Chapter 1

Removing Legacy Authentication Support

- Database Remove the legacy field from the Users table.
- Config Remove the "salt" parameter from the global config.
- Queries Remove/update queries which reference the legacy field.
- Auth Remove the legacy struct from the `auth_t` typedef.
- Code Remove the legacy routines and any code which references the `auth->legacy` structure, and all references to the `auth_legacy_t` structure.
- Structures `auth_t` (legacy) `auth_legacy_t`

Chapter 2

Data Structure Index

2.1 Data Structures

Here are the data structures with brief descriptions:

Chapter 3

File Index

3.1 File List

Here is a list of all files with brief descriptions:

src/magma.c	821
src/magma.h	822
src/queries.h	2068
src/core/core.h	223
src/core/type.c	610
src/core/buckets/arrays.c	161
src/core/buckets/buckets.h	166
src/core/buckets/pool.c	181
src/core/buckets/stacked.c	187
src/core/checksum/adler.c	189
src/core/checksum/checksum.h	190
src/core/checksum/crc.c	194
src/core/checksum/fletcher.c	199
src/core/checksum/murmur.c	200
src/core/classify/ascii.c	201
src/core/classify/classify.h	205
src/core/compare/compare.h	209
src/core/compare/ends.c	214
src/core/compare/equal.c	215
src/core/compare/search.c	217
src/core/compare/starts.c	222
src/core/encodings/base64.c	232
src/core/encodings/encodings.h	237
src/core/encodings/hex.c	249
src/core/encodings/mappings.c	253
src/core/encodings/qp.c	254
src/core/encodings/url.c	255
src/core/encodings/zbase32.c	257
src/core/host/backtrace.c (A simple function for dumping a stack trace to standard output)	258
src/core/host/color.c	259
src/core/host/errors.c (Functions to help handle errno)	265
src/core/host/files.c	274
src/core/host/folder.c	277
src/core/host/host.c	278
src/core/host/host.h	279
src/core/host/ip.c (Generic interface for parsing, and manipulating the IP address structure)	307

src/core/host/ process.c	314
src/core/host/ signals.c (Functions to help handle signals)	318
src/core/host/ spool.c	319
src/core/host/ tcp.c (Generic fuctions for interaction with TCP/IP socket connections)	323
src/core/indexes/ cursors.c	326
src/core/indexes/ hashed.c	330
src/core/indexes/ indexes.h	336
src/core/indexes/ inx.c	348
src/core/indexes/ linked.c	355
src/core/memory/ align.c	364
src/core/memory/ bitwise.c	365
src/core/memory/ memory.c	370
src/core/memory/ memory.h	376
src/core/memory/ secure.c	386
src/core/parsers/ bitwise.c	367
src/core/parsers/ case.c	392
src/core/parsers/ line.c	398
src/core/parsers/ parsers.h	442
src/core/parsers/ time.c	473
src/core/parsers/ token.c	475
src/core/parsers/ trim.c	482
src/core/parsers/formats/ formats.h	394
src/core/parsers/formats/ nvp.c	396
src/core/parsers/numbers/ clamp.c	400
src/core/parsers/numbers/ digits.c	404
src/core/parsers/numbers/ numbers.c	407
src/core/parsers/numbers/ numbers.h	422
src/core/parsers/special/ bracket.c	471
src/core/parsers/special/ special.h	472
src/core/strings/ allocation.c	484
src/core/strings/ data.c	493
src/core/strings/ info.c	503
src/core/strings/ length.c	506
src/core/strings/ multi.c	510
src/core/strings/ nuller.c	516
src/core/strings/ opts.c	521
src/core/strings/ print.c	523
src/core/strings/ replace.c	527
src/core/strings/ shortcuts.c	528
src/core/strings/ strings.h	533
src/core/strings/ validate.c	579
src/core/thread/ keys.c	583

Chapter 4

Data Structure Documentation

4.1 `__attribute__` Struct Reference

```
#include <http.h>
```

Data Fields

- struct {
 - `int_t` cookie
 - `int_t` connection } response
- `session_t` * session
- `http_method_t` method
- `inx_t` * pairs
- `inx_t` * headers
- `int_t` mode
- `int_t` merged
- `int_t` port
- `stringer_t` * host
- `stringer_t` * location
- `stringer_t` * cookie
- `stringer_t` * agent
- `stringer_t` * body
- union {
 - struct {
 - `uint64_t` id
 - `json_t` * request
 - `json_t` * params } portal };
- `bool_t` expunge
- `meta_user_t` * user
- `int_t` session_state
- `stringer_t` * username
- `uint64_t` usernum

4.1.1 Detailed Description

Definition at line 53 of file http.h.

4.1.2 Field Documentation

4.1.2.1 union { ... }

4.1.2.2 stringer_t * __attribute__::agent

Definition at line 64 of file http.h.

Referenced by __attribute__().

4.1.2.3 stringer_t * __attribute__::body

Definition at line 64 of file http.h.

4.1.2.4 int_t __attribute__::connection

Definition at line 57 of file http.h.

4.1.2.5 stringer_t * __attribute__::cookie

Definition at line 64 of file http.h.

4.1.2.6 int_t __attribute__::cookie

Definition at line 56 of file http.h.

4.1.2.7 bool_t __attribute__::expunge

Definition at line 12 of file pop.h.

4.1.2.8 inx_t * __attribute__::headers

Definition at line 62 of file http.h.

4.1.2.9 stringer_t* __attribute__::host

Definition at line 64 of file http.h.

Referenced by __attribute__().

4.1.2.10 uint64_t __attribute__::id

Definition at line 68 of file http.h.

4.1.2.11 stringer_t * __attribute__::location

Definition at line 64 of file http.h.

4.1.2.12 `int_t __attribute__::merged`

Definition at line 63 of file `http.h`.

4.1.2.13 `http_method_t __attribute__::method`

Definition at line 61 of file `http.h`.

4.1.2.14 `int_t __attribute__::mode`

Definition at line 63 of file `http.h`.

4.1.2.15 `inx_t* __attribute__::pairs`

Definition at line 62 of file `http.h`.

4.1.2.16 `json_t * __attribute__::params`

Definition at line 69 of file `http.h`.

4.1.2.17 `int_t __attribute__::port`

Definition at line 63 of file `http.h`.

4.1.2.18 `struct { ... } __attribute__::portal`**4.1.2.19 `json_t* __attribute__::request`**

Definition at line 69 of file `http.h`.

Referenced by `__attribute__()`.

4.1.2.20 `struct { ... } __attribute__::response`**4.1.2.21 `session_t* __attribute__::session`**

Definition at line 60 of file `http.h`.

4.1.2.22 `int_t __attribute__::session_state`

Definition at line 14 of file `pop.h`.

Referenced by `__attribute__()`.

4.1.2.23 `meta_user_t* __attribute__::user`

Definition at line 13 of file `pop.h`.

Referenced by `__attribute__()`.

4.1.2.24 stringer_t* __attribute__::username

Definition at line 15 of file pop.h.

Referenced by __attribute__().

4.1.2.25 uint64_t __attribute__::usernum

Definition at line 16 of file pop.h.

Referenced by __attribute__().

4.2 api_lookup_t Struct Reference

Data Fields

- [chr_t](#) * [string](#)
- void(* [callback](#))([connection_t](#) *con)

4.2.1 Detailed Description

Definition at line 10 of file json_api.c.

4.2.2 Field Documentation

4.2.2.1 void(* api_lookup_t::callback)(connection_t *con)

Referenced by json_api_dispatch().

4.2.2.2 chr_t* api_lookup_t::string

Definition at line 11 of file json_api.c.

Referenced by json_api_dispatch().

4.3 auth_legacy_t Struct Reference

```
#include <auth.h>
```

Data Fields

- [stringer_t](#) * key
- [stringer_t](#) * token

4.3.1 Detailed Description

Definition at line 26 of file auth.h.

4.3.2 Field Documentation

4.3.2.1 [stringer_t](#)* auth_legacy_t::key

Definition at line 27 of file auth.h.

Referenced by [auth_legacy\(\)](#), [auth_legacy_free\(\)](#), and [auth_login\(\)](#).

4.3.2.2 [stringer_t](#)* auth_legacy_t::token

Definition at line 28 of file auth.h.

Referenced by [auth_legacy\(\)](#), [auth_legacy_free\(\)](#), and [auth_login\(\)](#).

4.4 auth_stacie_t Struct Reference

```
#include <auth.h>
```

Data Fields

- struct {
 stringer_t * master
 stringer_t * password
} keys
- struct {
 stringer_t * verification
 stringer_t * ephemeral
} tokens

4.4.1 Detailed Description

Definition at line 31 of file auth.h.

4.4.2 Field Documentation

4.4.2.1 stringer_t* auth_stacie_t::ephemeral

Definition at line 40 of file auth.h.

Referenced by auth_response(), auth_stacie(), and auth_stacie_free().

4.4.2.2 struct { ... } auth_stacie_t::keys

Referenced by auth_login(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.4.2.3 stringer_t* auth_stacie_t::master

Definition at line 34 of file auth.h.

Referenced by auth_login(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.4.2.4 stringer_t* auth_stacie_t::password

Definition at line 35 of file auth.h.

Referenced by auth_stacie(), and auth_stacie_free().

4.4.2.5 struct { ... } auth_stacie_t::tokens

Referenced by auth_login(), auth_response(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.4.2.6 `stringer_t* auth_stacie_t::verification`

Definition at line 39 of file `auth.h`.

Referenced by `auth_login()`, `auth_stacie()`, `auth_stacie_free()`, and `register_data_insert_user()`.

4.5 auth_t Struct Reference

```
#include <auth.h>
```

Data Fields

- uint64_t `usernum`
- `stringer_t` * `username`
- struct {
 - uint8_t `locked` } `status`
- struct {
 - uint64_t `bonus`
 - `stringer_t` * `salt`
 - `stringer_t` * `nonce` } `seasoning`
- struct {
 - `stringer_t` * `master` } `keys`
- struct {
 - `stringer_t` * `ephemeral`
 - `stringer_t` * `verification` } `tokens`
- struct {
 - `stringer_t` * `key`
 - `stringer_t` * `token` } `legacy`

4.5.1 Detailed Description

Definition at line 45 of file `auth.h`.

4.5.2 Field Documentation

4.5.2.1 uint64_t auth_t::bonus

Definition at line 55 of file `auth.h`.

Referenced by `auth_data_fetch()`, `auth_login()`, and `auth_response()`.

4.5.2.2 stringer_t* auth_t::ephemeral

Definition at line 65 of file `auth.h`.

Referenced by `auth_free()`, and `auth_response()`.

4.5.2.3 stringer_t* auth_t::key

Definition at line 70 of file auth.h.

Referenced by auth_free(), and auth_login().

4.5.2.4 struct { ... } auth_t::keys

Referenced by api_endpoint_auth(), auth_free(), auth_login(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.5.2.5 struct { ... } auth_t::legacy

Referenced by auth_data_fetch(), auth_free(), and auth_login().

4.5.2.6 uint8_t auth_t::locked

Definition at line 51 of file auth.h.

Referenced by auth_data_fetch(), auth_login(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), and smtp_auth_plain().

4.5.2.7 stringer_t* auth_t::master

Definition at line 61 of file auth.h.

Referenced by api_endpoint_auth(), auth_free(), auth_login(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.5.2.8 stringer_t* auth_t::nonce

Definition at line 57 of file auth.h.

Referenced by auth_challenge(), auth_free(), and auth_response().

4.5.2.9 stringer_t* auth_t::salt

Definition at line 56 of file auth.h.

Referenced by api_endpoint_auth(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.5.2.10 struct { ... } auth_t::seasoning

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.5.2.11 struct { ... } auth_t::status

Referenced by auth_data_fetch(), auth_login(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), and smtp_auth_plain().

4.5.2.12 stringer_t* auth_t::token

Definition at line 71 of file auth.h.

Referenced by auth_data_fetch(), auth_free(), and auth_login().

4.5.2.13 struct { ... } auth_t::tokens

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and teacher_process().

4.5.2.14 stringer_t* auth_t::username

Definition at line 48 of file auth.h.

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), and smtp_auth_plain().

4.5.2.15 uint64_t auth_t::usernum

Definition at line 47 of file auth.h.

Referenced by api_endpoint_auth(), auth_data_fetch(), auth_login(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.5.2.16 stringer_t* auth_t::verification

Definition at line 66 of file auth.h.

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and teacher_process().

4.6 batch_heap_t Struct Reference

```
#include <ed25519-donna-batchverify.h>
```

Data Fields

- unsigned char `r` [heap_batch_size][16]
- `ge25519` points [heap_batch_size]
- `bignum256modm` scalars [heap_batch_size]
- `heap_index_t` heap [heap_batch_size]
- `size_t` size

4.6.1 Detailed Description

Definition at line 13 of file ed25519-donna-batchverify.h.

4.6.2 Field Documentation

4.6.2.1 heap_index_t batch_heap_t::heap[heap_batch_size]

Definition at line 17 of file ed25519-donna-batchverify.h.

4.6.2.2 ge25519 batch_heap_t::points[heap_batch_size]

Definition at line 15 of file ed25519-donna-batchverify.h.

Referenced by ed25519_sign_open_batch().

4.6.2.3 unsigned char batch_heap_t::r[heap_batch_size][16]

Definition at line 14 of file ed25519-donna-batchverify.h.

Referenced by ed25519_sign_open_batch().

4.6.2.4 bignum256modm batch_heap_t::scalars[heap_batch_size]

Definition at line 16 of file ed25519-donna-batchverify.h.

Referenced by ed25519_sign_open_batch().

4.6.2.5 size_t batch_heap_t::size

Definition at line 18 of file ed25519-donna-batchverify.h.

4.7 cache_keys_t Struct Reference

```
#include <cache.h>
```

Data Fields

- [size_t offset](#)
- [multi_t norm](#)
- [char * name](#)
- [char * description](#)
- [bool_t required](#)

4.7.1 Detailed Description

Definition at line 11 of file `cache.h`.

4.7.2 Field Documentation

4.7.2.1 `char* cache_keys_t::description`

Definition at line 15 of file `cache.h`.

4.7.2.2 `char* cache_keys_t::name`

Definition at line 14 of file `cache.h`.

Referenced by `cache_set_value()`.

4.7.2.3 `multi_t cache_keys_t::norm`

Definition at line 13 of file `cache.h`.

Referenced by `cache_free()`, `cache_output_help()`, `cache_output_settings()`, `cache_set_value()`, and `cache_validate()`.

4.7.2.4 `size_t cache_keys_t::offset`

Definition at line 12 of file `cache.h`.

Referenced by `cache_free()`, `cache_output_settings()`, `cache_set_value()`, and `cache_validate()`.

4.7.2.5 `bool_t cache_keys_t::required`

Definition at line 16 of file `cache.h`.

Referenced by `cache_output_help()`.

4.8 cache_t Struct Reference

```
#include <cache.h>
```

Data Fields

- char * [name](#)
- uint32_t [port](#)
- uint32_t [weight](#)

4.8.1 Detailed Description

Definition at line 19 of file cache.h.

4.8.2 Field Documentation

4.8.2.1 char* cache_t::name

Definition at line 20 of file cache.h.

4.8.2.2 uint32_t cache_t::port

Definition at line 21 of file cache.h.

4.8.2.3 uint32_t cache_t::weight

Definition at line 22 of file cache.h.

4.9 cached_object Struct Reference

```
#include <cache.h>
```

Data Fields

- `time_t timestamp`
The UTC timestamp for when this object was cached. Used with ttl.
- `unsigned char id [32]`
The identifier of the cached item as a SHA-256 hash.
- `cached_data_type_t dtype`
The type of the cached data being stored.
- `unsigned long ttl`
Optional time-to-live in seconds.
- `time_t expiration`
The time when the record will expire, in UTC.
- `int relaxed`
Whether or not the cache follows a relaxed eviction policy.
- `void * data`
The data associated with the cached object.
- `struct cached_object * prev`
A pointer to the previous cached object in the linked list.
- `struct cached_object * next`
A pointer to the next cached object in the linked list.
- `unsigned char persists`
Not everything in the cache should be persisted.
- `struct cached_object * shadow`

4.9.1 Detailed Description

Definition at line 34 of file `cache.h`.

4.9.2 Field Documentation

4.9.2.1 `void* cached_object::data`

The data associated with the cached object.

Definition at line 41 of file `cache.h`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_cached_object_exists_cmp()`, `_clone_cached_object()`, `_create_cached_object()`, `_destroy_cache_entry()`, `_do_ocsp_validation()`, `_dump_cache()`, `_dump_cache_data()`, `_find_cached_object_cmp()`, `_fixup_dnskey_validation()`, `_get_cache_obj_data()`, `_get_dime_record()`, `_load_cache_contents()`, `_remove_cached_object_cmp()`, `_save_cache_contents()`, and `_unlink_object()`.

4.9.2.2 `cached_data_type_t` `cached_object::dtype`

The type of the cached data being stored.

Definition at line 37 of file `cache.h`.

Referenced by `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_destroy_cache_entry()`, `_dump_cache_data()`, `_get_cache_obj_data()`, `_load_cache_contents()`, `_replace_object()`, and `_unlink_object()`.

4.9.2.3 `time_t` `cached_object::expiration`

The time when the record will expire, in UTC.

Definition at line 39 of file `cache.h`.

Referenced by `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_dump_cache()`, `_get_dime_record()`, `_is_object_expired()`, and `_load_cache_contents()`.

4.9.2.4 `unsigned char` `cached_object::id[32]`

The identifier of the cached item as a SHA-256 hash.

Definition at line 36 of file `cache.h`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_cached_object_exists()`, `_clone_cached_object()`, `_find_cached_object()`, `_load_cache_contents()`, `_remove_cached_object()`, and `_replace_object()`.

4.9.2.5 `struct cached_object*` `cached_object::next` `[read]`

A pointer to the next cached object in the linked list.

Definition at line 43 of file `cache.h`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_cached_object_exists()`, `_cached_object_exists_cmp()`, `_dump_cache()`, `_find_cached_object()`, `_find_cached_object_cmp()`, `_fixup_dnskey_validation()`, `_load_cache_contents()`, `_remove_cached_object()`, `_remove_cached_object_cmp()`, `_replace_object()`, `_save_cache_contents()`, and `_unlink_object()`.

4.9.2.6 `unsigned char` `cached_object::persists`

Not everything in the cache should be persisted.

Definition at line 44 of file `cache.h`.

Referenced by `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_dump_cache()`, `_fixup_dnskey_validation()`, `_load_cache_contents()`, and `_save_cache_contents()`.

4.9.2.7 `struct cached_object*` `cached_object::prev` `[read]`

A pointer to the previous cached object in the linked list.

Definition at line 42 of file `cache.h`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_replace_object()`, and `_unlink_object()`.

4.9.2.8 `int` `cached_object::relaxed`

Whether or not the cache follows a relaxed eviction policy.

Definition at line 40 of file `cache.h`.

Referenced by `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_dump_cache()`, and `_is_object_expired()`.

4.9.2.9 `struct cached_object* cached_object::shadow` [read]

A saved copy of the "real" cache entry to be saved, if this cached object is merely temporarily overriding it.

Definition at line 45 of file `cache.h`.

Referenced by `_dump_cache()`, `_replace_object()`, and `_save_cache_contents()`.

4.9.2.10 `time_t cached_object::timestamp`

The UTC timestamp for when this object was cached. Used with `ttl`.

Definition at line 35 of file `cache.h`.

Referenced by `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_dump_cache()`, `_is_object_expired()`, and `_load_cache_contents()`.

4.9.2.11 `unsigned long cached_object::ttl`

Optional time-to-live in seconds.

Definition at line 38 of file `cache.h`.

Referenced by `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_dump_cache()`, `_is_object_expired()`, and `_load_cache_contents()`.

4.10 cached_store_t Struct Reference

```
#include <cache.h>
```

Data Fields

- [cached_data_type_t dtype](#)
The type of data that will be stored within.
- `const char *` [description](#)
A text description of the cache store.
- `unsigned char` [internal](#)
- `cached_object_t *` [head](#)
A pointer to the head of the cached object list.
- `pthread_mutex_t` [lock](#)
For multi-threaded safe code.
- `void(*` [destructor](#) `)(void *)`
A function pointer to a destructor used to free cached object data.
- `void *(*` [serialize](#) `)(void *, size_t *)`
A function pointer to a routine used to serialize cached data.
- `void *(*` [deserialize](#) `)(void *, size_t)`
A function pointer to a routine used to deserialize cached data.
- `void(*` [dump](#) `)(FILE *, void *, int)`
A function pointer to a routine used to dump the cached data.
- `void *(*` [clone](#) `)(void *)`

4.10.1 Detailed Description

Definition at line 50 of file cache.h.

4.10.2 Field Documentation

4.10.2.1 `void(* cached_store_t::clone)(void *)`

An optional pointer to a routine that can be used to clone data. If not specified, the serialize and deserialize routine will be used together to recreate the functionality of this function.

Referenced by `_clone_cached_object()`.

4.10.2.2 `const char* cached_store_t::description`

A text description of the cache store.

Definition at line 52 of file cache.h.

4.10.2.3 void>(* cached_store_t::deserialize)(void *, size_t)

A function pointer to a routine used to deserialize cached data.

Referenced by _clone_cached_object(), and _load_cache_contents().

4.10.2.4 void(* cached_store_t::destructor)(void *)

A function pointer to a destructor used to free cached object data.

Referenced by _destroy_cache_entry(), and _unlink_object().

4.10.2.5 cached_data_type_t cached_store_t::dtype

The type of data that will be stored within.

Definition at line 51 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), and _dump_cache().

4.10.2.6 void(* cached_store_t::dump)(FILE *, void *, int)

A function pointer to a routine used to dump the cached data.

Referenced by _dump_cache_data(), and _unlink_object().

4.10.2.7 cached_object_t* cached_store_t::head

A pointer to the head of the cached object list.

Definition at line 55 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), _replace_object(), _save_cache_contents(), and _unlink_object().

4.10.2.8 unsigned char cached_store_t::internal

Determines whether the cached store is for internal use only. If it is, objects will not be cloned before being returned to the caller.

Definition at line 53 of file cache.h.

Referenced by _clone_cached_object(), and _get_cache_obj_data().

4.10.2.9 pthread_mutex_t cached_store_t::lock

For multi-threaded safe code.

Definition at line 56 of file cache.h.

Referenced by _lock_cache_store(), and _unlock_cache_store().

4.10.2.10 void(* cached_store_t::serialize)(void *, size_t *)

A function pointer to a routine used to serialize cached data.

Referenced by _clone_cached_object().

4.11 derror_t Struct Reference

```
#include <error_codes.h>
```

Data Fields

- [dime_errcode_t](#) code
- char const * [message](#)

4.11.1 Detailed Description

Definition at line 12 of file error_codes.h.

4.11.2 Field Documentation

4.11.2.1 `dime_errcode_t` `derror_t::code`

Definition at line 13 of file error_codes.h.

4.11.2.2 `char const*` `derror_t::message`

Definition at line 14 of file error_codes.h.

4.12 dime_ctx Struct Reference

Data Fields

- [log_function_t log_callback](#)

4.12.1 Detailed Description

Definition at line 57 of file dime_ctx.c.

4.12.2 Field Documentation

4.12.2.1 log_function_t dime_ctx::log_callback

Definition at line 58 of file dime_ctx.c.

Referenced by dime_ctx_log().

4.13 dime_record_t Struct Reference

```
#include <mrec.h>
```

Data Fields

- unsigned short [version](#)
The DIME management record syntax version.
- unsigned char ** [pubkey](#)
An array of 32-byte ED25519 organizational public key(s) (POKs).
- unsigned char ** [tlssig](#)
An array of 64-byte TLS signature(s) for MX (or DX/KS) by the POK(s).
- [dime_msg_policy](#) policy
Policy for sending/accepting messages.
- char * [syndicates](#)
Alternative authoritative signet lookup sources.
- char ** [dx](#)
An array of CNAME(s) for DIME delivery host (if not present, then MX).
- unsigned long [expiry](#)
Number of days before a cached management record is discarded.
- [dime_sub_policy](#) subdomain
Determines whether subdomains will have authority over their own records.
- int [validated](#)
1 if validated by DNSSEC; 0 if not DNSSEC-protected; -1 if DNSSEC sig failed.

4.13.1 Detailed Description

Definition at line 32 of file mrec.h.

4.13.2 Field Documentation

4.13.2.1 char** dime_record_t::dx

An array of CNAME(s) for DIME delivery host (if not present, then MX).

Definition at line 38 of file mrec.h.

Referenced by `_deserialize_dime_record_cb()`, `_destroy_dime_record()`, `_dump_dime_record_cb()`, `_parse_dime_record()`, `_serialize_dime_record_cb()`, and `_sgnt_resolv_dmtpl_connect()`.

4.13.2.2 unsigned long dime_record_t::expiry

Number of days before a cached management record is discarded.

Definition at line 39 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _get_dime_record(), and _serialize_dime_record_cb().

4.13.2.3 dime_msg_policy dime_record_t::policy

Policy for sending/accepting messages.

Definition at line 36 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _validate_dime_record().

4.13.2.4 unsigned char** dime_record_t::pubkey

An array of 32-byte ED25519 organizational public key(s) (POKs).

Definition at line 34 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), _get_signet(), _parse_dime_record(), _serialize_dime_record_cb(), _validate_dime_record(), and _verify_dx_certificate().

4.13.2.5 dime_sub_policy dime_record_t::subdomain

Determines whether subdomains will have authority over their own records.

Definition at line 40 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _validate_dime_record().

4.13.2.6 char* dime_record_t::syndicates

Alternative authoritative signet lookup sources.

Definition at line 37 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), and _serialize_dime_record_cb().

4.13.2.7 unsigned char** dime_record_t::tlssig

An array of 64-byte TLS signature(s) for MX (or DX/KS) by the POK(s).

Definition at line 35 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _verify_dx_certificate().

4.13.2.8 int dime_record_t::validated

1 if validated by DNSSEC; 0 if not DNSSEC-protected; -1 if DNSSEC sig failed.

Definition at line 41 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _get_dime_record(), _serialize_dime_record_cb(), _sgnt_resolve_dmtpt_connect(), and _verify_dx_certificate().

4.13.2.9 unsigned short dime_record_t::version

The DIME management record syntax version.

Definition at line 33 of file mrec.h.

Referenced by `_deserialize_dime_record_cb()`, `_dump_dime_record_cb()`, `_parse_dime_record()`, `_serialize_dime_record_cb()`, and `_validate_dime_record()`.

4.14 dmime_chunk_key_t Struct Reference

4.23 dmtplib_session_t Struct Reference

```
#include <dmtplib.h>
```

Data Fields

- char * [domain](#)
The name of the dark domain underlying the DMTP connection.
- char * [dx](#)
The canonical name of the DX that we're connected to.
- SSL * [con](#)
The handle to this DMTP session's underlying SSL connection.
- [dime_record_t](#) * [drec](#)
The DIME management record associated with this dark domain.
- [dmtplib_mode_t](#) [mode](#)
The current mode of this connection (if made through dual mode).
- unsigned int [active](#)
Boolean flag: whether or not this session is active.
- int [_fd](#)
- unsigned char [_inbuf](#) [DMTP_LINE_BUF_SIZE+1]
- size_t [_inpos](#)

4.23.1 Detailed Description

Definition at line 12 of file dmtplib.h.

4.23.2 Field Documentation

4.23.2.1 int dmtplib_session_t::_fd

Definition at line 37 of file dmtplib.h.

Referenced by [_dx_connect_dual\(\)](#), [_dx_connect_standard\(\)](#), [_sgnt_resolv_destroy_dmtplib_session\(\)](#), [_sgnt_resolv_dmtplib_initiate_starttls\(\)](#), [_sgnt_resolv_dmtplib_issue_command\(\)](#), [_sgnt_resolv_dmtplib_quit\(\)](#), [_sgnt_resolv_dmtplib_write_data\(\)](#), and [_sgnt_resolv_read_dmtplib_line\(\)](#).

4.23.2.2 unsigned char dmtplib_session_t::_inbuf[DMTP_LINE_BUF_SIZE+1]

Definition at line 38 of file dmtplib.h.

Referenced by [_sgnt_resolv_destroy_dmtplib_session\(\)](#), and [_sgnt_resolv_read_dmtplib_line\(\)](#).

4.23.2.3 size_t dmtplib_session_t::_inpos

Definition at line 39 of file dmtplib.h.

Referenced by [_sgnt_resolv_read_dmtplib_line\(\)](#).

4.23.2.4 unsigned int dmtplib_session_t::active

Boolean flag: whether or not this session is active.

Definition at line 35 of file dmtplib.h.

Referenced by _dx_connect_dual(), _sgnt_resolv_dmtplib_quit(), and _sgnt_resolv_read_dmtplib_line().

4.23.2.5 SSL* dmtplib_session_t::con

The handle to this DMTP session's underlying SSL connection.

Definition at line 32 of file dmtplib.h.

Referenced by _dx_connect_standard(), _sgnt_resolv_destroy_dmtplib_session(), _sgnt_resolv_dmtplib_initiate_starttls(), _sgnt_resolv_dmtplib_issue_command(), _sgnt_resolv_dmtplib_quit(), _sgnt_resolv_dmtplib_write_data(), _sgnt_resolv_read_dmtplib_line(), and _verify_dx_certificate().

4.23.2.6 char* dmtplib_session_t::domain

The name of the dark domain underlying the DMTP connection.

Definition at line 30 of file dmtplib.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), and _sgnt_resolv_destroy_dmtplib_session().

4.23.2.7 dime_record_t* dmtplib_session_t::drec

The DIME management record associated with this dark domain.

Definition at line 33 of file dmtplib.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _get_sigmet(), _sgnt_resolv_destroy_dmtplib_session(), and _verify_dx_certificate().

4.23.2.8 char* dmtplib_session_t::dx

The canonical name of the DX that we're connected to.

Definition at line 31 of file dmtplib.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _sgnt_resolv_destroy_dmtplib_session(), and _verify_dx_certificate().

4.23.2.9 dmtplib_mode_t dmtplib_session_t::mode

The current mode of this connection (if made through dual mode).

Definition at line 34 of file dmtplib.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _sgnt_resolv_dmtplib_initiate_starttls(), and _sgnt_resolv_read_dmtplib_line().

4.24.2.11 dnskey_t** dnskey::signkeys

The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DNSKEY.

Definition at line 114 of file dns.h.

Referenced by `_clone_dnskey_record_cb()`, `_destroy_dnskey()`, `_dump_dnskey_record_cb()`, and `_is_validated_key()`.

4.24.2.12 unsigned int dnskey::validated

Has this key been validated?

Definition at line 116 of file dns.h.

Referenced by `_clone_dnskey_record_cb()`, `_deserialize_dnskey_record_cb()`, `_fixup_dnskey_validation()`, `_is_validated_key()`, `_load_dnskey_file()`, and `_serialize_dnskey_record_cb()`.

4.25 ds Struct Reference

```
#include <dns.h>
```

Data Fields

- char * [label](#)
- unsigned char [algorithm](#)
- unsigned char [digest_type](#)
- unsigned int [keytag](#)
- unsigned char * [digest](#)
- size_t [diglen](#)
- unsigned char [validated](#)

This is for the cache.

- [dnskey_t](#) ** [signkeys](#)

The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DS.

4.25.1 Detailed Description

Our own internal representation of certain RRs.

Definition at line 94 of file dns.h.

4.25.2 Field Documentation

4.25.2.1 unsigned char ds::algorithm

Definition at line 96 of file dns.h.

Referenced by [_add_ds_entry\(\)](#), [_deserialize_ds_record_cb\(\)](#), [_dump_ds_record_cb\(\)](#), [_get_ds_by_dnskey\(\)](#), and [_serialize_ds_record_cb\(\)](#).

4.25.2.2 unsigned char* ds::digest

Definition at line 99 of file dns.h.

Referenced by [_add_ds_entry\(\)](#), [_deserialize_ds_record_cb\(\)](#), [_destroy_ds\(\)](#), [_ds_comparator\(\)](#), [_dump_ds_record_cb\(\)](#), [_get_ds_by_dnskey\(\)](#), and [_serialize_ds_record_cb\(\)](#).

4.25.2.3 unsigned char ds::digest_type

Definition at line 97 of file dns.h.

Referenced by [_add_ds_entry\(\)](#), [_deserialize_ds_record_cb\(\)](#), [_dump_ds_record_cb\(\)](#), [_get_ds_by_dnskey\(\)](#), and [_serialize_ds_record_cb\(\)](#).

4.25.2.4 size_t ds::diglen

Definition at line 100 of file dns.h.

Referenced by [_add_ds_entry\(\)](#), [_deserialize_ds_record_cb\(\)](#), [_ds_comparator\(\)](#), [_dump_ds_record_cb\(\)](#), [_get_ds_by_dnskey\(\)](#), and [_serialize_ds_record_cb\(\)](#).

4.25.2.5 unsigned int ds::keytag

Definition at line 98 of file dns.h.

Referenced by `_add_ds_entry()`, `_deserialize_ds_record_cb()`, `_ds_comparator()`, `_dump_ds_record_cb()`, `_get_ds_by_dnskey()`, and `_serialize_ds_record_cb()`.

4.25.2.6 char* ds::label

Definition at line 95 of file dns.h.

Referenced by `_add_ds_entry()`, `_deserialize_ds_record_cb()`, `_destroy_ds()`, `_ds_comparator()`, `_dump_ds_record_cb()`, `_get_ds_by_dnskey()`, and `_serialize_ds_record_cb()`.

4.25.2.7 dnskey_t** ds::signkeys

The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DS.

Definition at line 102 of file dns.h.

Referenced by `_destroy_ds()`, and `_dump_ds_record_cb()`.

4.25.2.8 unsigned char ds::validated

This is for the cache.

Definition at line 101 of file dns.h.

Referenced by `_deserialize_ds_record_cb()`, `_dump_ds_record_cb()`, and `_serialize_ds_record_cb()`.

4.26 ED25519_KEY Struct Reference

```
#include <dcrypto.h>
```

Data Fields

- [ed25519_secret_key](#) private_key
- [ed25519_public_key](#) public_key

4.26.1 Detailed Description

Definition at line 26 of file `dcrypto.h`.

4.26.2 Field Documentation

4.26.2.1 `ed25519_secret_key` `ED25519_KEY::private_key`

Definition at line 27 of file `dcrypto.h`.

Referenced by `_deserialize_ed25519_privkey()`, `_ed25519_sign_data()`, `_generate_ed25519_keypair()`, and `_load_ed25519_privkey()`.

4.26.2.2 `ed25519_public_key` `ED25519_KEY::public_key`

Definition at line 28 of file `dcrypto.h`.

Referenced by `_deserialize_ed25519_privkey()`, `_deserialize_ed25519_pubkey()`, `_ed25519_sign_data()`, `_ed25519_verify_sig()`, `_generate_ed25519_keypair()`, `_load_ed25519_privkey()`, and `_verify_dx_certificate()`.

4.27 encrypt_ctx Struct Reference

Data Fields

- EC_GROUP * [encryption_group](#)
- EVP_MD const * [ecies_envelope_evp](#)

4.27.1 Detailed Description

Definition at line 11 of file encrypt.c.

4.27.2 Field Documentation

4.27.2.1 EVP_MD const* encrypt_ctx::ecies_envelope_evp

Definition at line 13 of file encrypt.c.

4.27.2.2 EC_GROUP* encrypt_ctx::encryption_group

Definition at line 12 of file encrypt.c.

Referenced by `encrypt_ctx_free()`, and `encrypt_keypair_generate()`.

4.28 encrypt_keypair_t Struct Reference

```
#include <encrypt.h>
```

Data Fields

- char [unused](#) [1]

4.28.1 Detailed Description

Definition at line 8 of file encrypt.h.

4.28.2 Field Documentation

4.28.2.1 char encrypt_keypair_t::unused[1]

Definition at line 8 of file encrypt.h.

4.29 `err_desc_t` Struct Reference

```
#include <error.h>
```

Data Fields

- unsigned int `errcode`
- const char * `errmsg`

4.29.1 Detailed Description

Definition at line 59 of file `error.h`.

4.29.2 Field Documentation

4.29.2.1 unsigned int `err_desc_t::errcode`

Definition at line 60 of file `error.h`.

4.29.2.2 const char* `err_desc_t::errmsg`

Definition at line 61 of file `error.h`.

Referenced by `get_error_string()`.

4.30 ge25519_niels_t Struct Reference

```
#include <ed25519-donna.h>
```

Data Fields

- [bignum25519 ysubx](#)
- [bignum25519 xaddy](#)
- [bignum25519 t2d](#)

4.30.1 Detailed Description

Definition at line 89 of file ed25519-donna.h.

4.30.2 Field Documentation

4.30.2.1 bignum25519 ge25519_niels_t::t2d

Definition at line 90 of file ed25519-donna.h.

4.30.2.2 bignum25519 ge25519_niels_t::xaddy

Definition at line 90 of file ed25519-donna.h.

4.30.2.3 bignum25519 ge25519_niels_t::ysubx

Definition at line 90 of file ed25519-donna.h.

4.31 ge25519_p1p1_t Struct Reference

```
#include <ed25519-donna.h>
```

Data Fields

- [bignum25519 x](#)
- [bignum25519 y](#)
- [bignum25519 z](#)
- [bignum25519 t](#)

4.31.1 Detailed Description

Definition at line 85 of file ed25519-donna.h.

4.31.2 Field Documentation

4.31.2.1 bignum25519 ge25519_p1p1_t::t

Definition at line 86 of file ed25519-donna.h.

4.31.2.2 bignum25519 ge25519_p1p1_t::x

Definition at line 86 of file ed25519-donna.h.

4.31.2.3 bignum25519 ge25519_p1p1_t::y

Definition at line 86 of file ed25519-donna.h.

4.31.2.4 bignum25519 ge25519_p1p1_t::z

Definition at line 86 of file ed25519-donna.h.

4.32 ge25519_pniels_t Struct Reference

```
#include <ed25519-donna.h>

Definition at line 1698 of file ed25519-ref10.c.

4.39 generated_data_t Struct Reference

Data Fields

- unsigned char [pk](#) [32]
- unsigned char [sig](#) [64]
- int [valid](#)

4.39.1 Detailed Description

Definition at line 121 of file fuzz-ed25519.c.

4.39.2 Field Documentation

4.39.2.1 unsigned char generated_data_t::pk[32]

Definition at line 122 of file fuzz-ed25519.c.

Referenced by `main()`.

4.39.2.2 unsigned char generated_data_t::sig[64]

Definition at line 123 of file fuzz-ed25519.c.

Referenced by `main()`.

4.39.2.3 int generated_data_t::valid

Definition at line 124 of file fuzz-ed25519.c.

Referenced by `main()`.

4.40 http_content_t Struct Reference

```
#include <http.h>
```

Data Fields

- [stringer_t](#) * location
- [stringer_t](#) * resource
- [stringer_t](#) * type
- struct [http_content_t](#) * next

4.40.1 Detailed Description

Definition at line 41 of file http.h.

4.40.2 Field Documentation

4.40.2.1 stringer_t* http_content_t::location

Definition at line 42 of file http.h.

Referenced by [http_free_content\(\)](#).

4.40.2.2 struct http_content_t* http_content_t::next [read]

Definition at line 43 of file http.h.

4.40.2.3 stringer_t* http_content_t::resource

Definition at line 42 of file http.h.

Referenced by [http_free_content\(\)](#), [http_page_get\(\)](#), [http_response\(\)](#), [register_print_message\(\)](#), [register_print_step1\(\)](#), [register_print_step2\(\)](#), and [register_print_step3\(\)](#).

4.40.2.4 stringer_t* http_content_t::type

Definition at line 42 of file http.h.

Referenced by [contact_print_form\(\)](#), [contact_print_message\(\)](#), [http_free_content\(\)](#), [http_get_static\(\)](#), [http_get_template\(\)](#), [http_response\(\)](#), [portal_print_login\(\)](#), [register_print_message\(\)](#), [register_print_step1\(\)](#), [register_print_step2\(\)](#), [register_print_step3\(\)](#), [teacher_print_form\(\)](#), and [teacher_print_message\(\)](#).

4.41 http_data_t Struct Reference

```
#include <http.h>
```

Data Fields

- [HTTP_DATA](#) source
- [stringer_t](#) * name
- [stringer_t](#) * value

4.41.1 Detailed Description

Definition at line 36 of file http.h.

4.41.2 Field Documentation

4.41.2.1 stringer_t* http_data_t::name

Definition at line 38 of file http.h.

Referenced by [http_data_free\(\)](#), [http_data_get\(\)](#), [http_data_header_parse_line\(\)](#), [http_data_value_parse\(\)](#), [http_parse_header\(\)](#), and [portal_upload\(\)](#).

4.41.2.2 HTTP_DATA http_data_t::source

Definition at line 37 of file http.h.

Referenced by [http_data_get\(\)](#), [http_data_header_parse_line\(\)](#), and [http_data_value_parse\(\)](#).

4.41.2.3 stringer_t * http_data_t::value

Definition at line 38 of file http.h.

Referenced by [contact_business\(\)](#), [contact_print_form\(\)](#), [http_body\(\)](#), [http_data_free\(\)](#), [http_data_header_parse_line\(\)](#), [http_data_value_parse\(\)](#), [http_parse_header\(\)](#), [http_response_allow_cross\(\)](#), [multipart_get_boundary\(\)](#), [portal_upload\(\)](#), [register_business_step1\(\)](#), [register_business_step2\(\)](#), [register_process\(\)](#), and [teacher_process\(\)](#).

4.42 http_page_t Struct Reference

```
#include <http.h>
```

Data Fields

- xmlDocPtr [doc_obj](#)
- [http_content_t](#) * [content](#)
- xmlParserCtxtPtr [doc_ctx](#)
- xmlXPathContextPtr [xpath_ctx](#)

4.42.1 Detailed Description

Definition at line 46 of file `http.h`.

4.42.2 Field Documentation

4.42.2.1 http_content_t* http_page_t::content

Definition at line 48 of file `http.h`.

Referenced by `contact_print_form()`, `contact_print_message()`, `http_page_get()`, `portal_print_login()`, `teacher_print_form()`, and `teacher_print_message()`.

4.42.2.2 xmlParserCtxtPtr http_page_t::doc_ctx

Definition at line 49 of file `http.h`.

Referenced by `http_page_free()`, and `http_page_get()`.

4.42.2.3 xmlDocPtr http_page_t::doc_obj

Definition at line 47 of file `http.h`.

Referenced by `contact_print_form()`, `contact_print_message()`, `http_page_free()`, `http_page_get()`, `portal_print_login()`, `teacher_print_form()`, and `teacher_print_message()`.

4.42.2.4 xmlXPathContextPtr http_page_t::xpath_ctx

Definition at line 50 of file `http.h`.

Referenced by `contact_business_add_error()`, `contact_print_form()`, `contact_print_message()`, `http_page_free()`, `http_page_get()`, `portal_print_login()`, `teacher_add_error()`, `teacher_print_form()`, and `teacher_print_message()`.

4.43 imap_fetch_dataitems_t Struct Reference

```
#include <imap.h>
```

Data Fields

- [int_t uid](#)
- [int_t flags](#)
- [int_t internaldate](#)
- [int_t envelope](#)
- [int_t bodystructure](#)

- [array_t * peek](#)
- [array_t * peek_partial](#)
- [array_t * normal](#)
- [array_t * normal_partial](#)

4.43.1 Detailed Description

Definition at line 18 of file `imap.h`.

4.43.2 Field Documentation

4.43.2.1 `int_t imap_fetch_dataitems_t::body`

Definition at line 19 of file `imap.h`.

Referenced by `imap_fetch_message()`, and `imap_parse_dataitems()`.

4.43.2.2 `int_t imap_fetch_dataitems_t::bodystructure`

Definition at line 19 of file `imap.h`.

Referenced by `imap_fetch_message()`, and `imap_parse_dataitems()`.

4.43.2.3 `int_t imap_fetch_dataitems_t::envelope`

Definition at line 19 of file `imap.h`.

Referenced by `imap_fetch_message()`, and `imap_parse_dataitems()`.

4.43.2.4 `int_t imap_fetch_dataitems_t::flags`

Definition at line 19 of file `imap.h`.

Referenced by `imap_fetch_message()`, and `imap_parse_dataitems()`.

4.43.2.5 int_t imap_fetch_dataitems_t::internaldate

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.43.2.6 array_t * imap_fetch_dataitems_t::normal

Definition at line 20 of file imap.h.

Referenced by imap_fetch(), imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.7 array_t * imap_fetch_dataitems_t::normal_partial

Definition at line 20 of file imap.h.

Referenced by imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.8 array_t* imap_fetch_dataitems_t::peek

Definition at line 20 of file imap.h.

Referenced by imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.9 array_t * imap_fetch_dataitems_t::peek_partial

Definition at line 20 of file imap.h.

Referenced by imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.10 int_t imap_fetch_dataitems_t::rfc822

Definition at line 19 of file imap.h.

Referenced by imap_fetch(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.11 int_t imap_fetch_dataitems_t::rfc822_header

Definition at line 19 of file imap.h.

Referenced by imap_fetch(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.12 int_t imap_fetch_dataitems_t::rfc822_size

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.43.2.13 int_t imap_fetch_dataitems_t::rfc822_text

Definition at line 19 of file imap.h.

Referenced by imap_fetch(), imap_fetch_message(), and imap_parse_dataitems().

4.43.2.14 `int_t imap_fetch_dataitems_t::uid`

Definition at line 19 of file `imap.h`.

Referenced by `imap_fetch_message()`, and `imap_parse_dataitems()`.

4.44 imap_fetch_response_t Struct Reference

```
#include <imap.h>
```

Data Fields

- [stringer_t](#) * key
- [stringer_t](#) * value
- struct [imap_fetch_response_t](#) * next

4.44.1 Detailed Description

Definition at line 23 of file `imap.h`.

4.44.2 Field Documentation

4.44.2.1 `stringer_t*` `imap_fetch_response_t::key`

Definition at line 24 of file `imap.h`.

Referenced by `imap_fetch()`, `imap_fetch_response_add()`, `imap_fetch_response_free()`, `smtp_check_greylist()`, and `smtp_store_spamsig()`.

4.44.2.2 `struct imap_fetch_response_t*` `imap_fetch_response_t::next` `[read]`

Definition at line 25 of file `imap.h`.

Referenced by `imap_fetch()`, `imap_fetch_response_add()`, and `imap_fetch_response_free()`.

4.44.2.3 `stringer_t` * `imap_fetch_response_t::value`

Definition at line 24 of file `imap.h`.

Referenced by `imap_fetch()`, `imap_fetch_response_add()`, `imap_fetch_response_free()`, `imap_parse_address()`, and `smtp_check_greylist()`.

4.45 imap_folder_status_t Struct Reference

```

4.45.1 Detailed Description

Definition at line 14 of file `imap.h`.

4.45.2 Field Documentation

4.45.2.1 uint64_t imap_folder_status_t::first

Definition at line 15 of file `imap.h`.

Referenced by `imap_examine()`, `imap_folder_status()`, and `imap_select()`.

4.45.2.2 uint64_t imap_folder_status_t::foldernum

Definition at line 15 of file `imap.h`.

Referenced by `imap_examine()`, `imap_folder_status()`, `imap_select()`, and `imap_status()`.

4.45.2.3 uint64_t imap_folder_status_t::messages

Definition at line 15 of file `imap.h`.

Referenced by `imap_examine()`, `imap_folder_status()`, `imap_select()`, and `imap_status()`.

4.45.2.4 uint64_t imap_folder_status_t::recent

Definition at line 15 of file `imap.h`.

Referenced by `imap_examine()`, `imap_folder_status()`, `imap_select()`, and `imap_status()`.

4.45.2.5 uint64_t imap_folder_status_t::uidnext

Definition at line 15 of file `imap.h`.

Referenced by `imap_examine()`, `imap_folder_status()`, `imap_select()`, and `imap_status()`.

4.45.2.6 uint64_t imap_folder_status_t::unseen

Definition at line 15 of file `imap.h`.

Referenced by `imap_folder_status()`, and `imap_status()`.

4.46 ip_t Struct Reference

```
#include <host.h>
```

Data Fields

- sa_family_t [family](#)
- union {
 - struct in_addr [ip4](#)
 - struct in6_addr [ip6](#)
 - void * [ip](#)

4.46.1 Detailed Description

Definition at line 68 of file host.h.

4.46.2 Field Documentation

4.46.2.1 union { ... }

4.46.2.2 sa_family_t ip_t::family

Definition at line 69 of file host.h.

Referenced by `client_connect()`, `ip_addr_eq()`, `ip_addr_st()`, `ip_family()`, `ip_matches_subnet()`, `ip_octet()`, `ip_presentation()`, `ip_reversed()`, `ip_segment()`, `ip_standard()`, `ip_subnet()`, `ip_subnet_st()`, `ip_word()`, `net_trigger()`, `spf_check()`, and `tcp_addr_ip()`.

4.46.2.3 void* ip_t::ip

Definition at line 73 of file host.h.

Referenced by `con_addr()`, and `ip_matches_subnet()`.

4.46.2.4 struct in_addr ip_t::ip4 [read]

Definition at line 71 of file host.h.

Referenced by `client_connect()`, `ip_addr_eq()`, `ip_addr_st()`, `ip_octet()`, `ip_presentation()`, `ip_reversed()`, `ip_segment()`, `ip_standard()`, `ip_subnet()`, `ip_word()`, `net_trigger()`, `spf_check()`, and `tcp_addr_ip()`.

4.46.2.5 struct in6_addr ip_t::ip6 [read]

Definition at line 72 of file host.h.

Referenced by `client_connect()`, `ip_addr_eq()`, `ip_addr_st()`, `ip_localhost()`, `ip_octet()`, `ip_presentation()`, `ip_private()`, `ip_reversed()`, `ip_segment()`, `ip_standard()`, `ip_subnet()`, `ip_word()`, `net_trigger()`, `spf_check()`, and `tcp_addr_ip()`.

4.47 key_pair_t Struct Reference

```

4.50.1 Detailed Description

Definition at line 23 of file global.h.

4.50.2 Field Documentation

4.50.2.1 `stringer_t* magma_t::abuse`

Definition at line 35 of file global.h.

Referenced by `config_validate_settings()`, `contact_business()`, `http_response()`, `smtp_accept_message()`, and `smtp_rcpt_to()`.

4.50.2.2 `stringer_t* magma_t::active`

Definition at line 96 of file global.h.

Referenced by `imap_append_message()`, `mail_create_directory()`, `mail_db_insert_duplicate_message()`, `mail_db_insert_message()`, and `mail_message_path()`.

4.50.2.3 `uint32_t magma_t::address_length_limit`

Definition at line 103 of file global.h.

Referenced by `smtp_parse_mail_from_path()`, and `smtp_parse_rcpt_to()`.

4.50.2.4 `struct { ... } magma_t::admin`

Referenced by `config_validate_settings()`, `contact_business()`, `http_response()`, `register_business_step2()`, `smtp_accept_message()`, and `smtp_rcpt_to()`.

4.50.2.5 `bool_t magma_t::allow_cross_domain`

Definition at line 120 of file global.h.

4.50.2.6 `bool_t magma_t::available`

Definition at line 184 of file global.h.

4.50.2.7 `struct { ... } magma_t::blacklists`

Referenced by `config_free()`, `config_output_value()`, `config_output_value_generic()`, `config_value_set()`, and `smtp_check_rbl()`.

4.50.2.8 `stringer_t* magma_t::bypass_addr`

Definition at line 114 of file global.h.

4.50.2.9 `inx_t* magma_t::bypass_subnets`

Definition at line 115 of file global.h.

Referenced by `smtp_add_bypass_entry()`, and `smtp_bypass_check()`.

4.50.2.10 `struct { ... } magma_t::cache`

4.50.2.11 `stringer_t* magma_t::cache`

Definition at line 190 of file global.h.

Referenced by `cache_alloc()`, `cache_free()`, `cache_output_settings()`, `cache_start()`, `cache_stop()`, `cache_validate()`, and `config_validate_settings()`.

4.50.2.12 `bool_t magma_t::close`

Definition at line 119 of file global.h.

4.50.2.13 `struct { ... } magma_t::config`

Referenced by `args_parse()`, `config_load_file_settings()`, `config_output_settings()`, `config_validate_settings()`, `lib_load()`, and `system_init_resource_limits()`.

4.50.2.14 `uint32_t magma_t::connections`

Definition at line 179 of file global.h.

4.50.2.15 `struct { ... } magma_t::contact`

4.50.2.16 `stringer_t* magma_t::contact`

Definition at line 34 of file global.h.

Referenced by `config_validate_settings()`, `contact_business()`, `http_response()`, `register_business_step2()`, `smtp_accept_message()`, and `smtp_rcpt_to()`.

4.50.2.17 `bool_t magma_t::content`

Definition at line 85 of file global.h.

Referenced by `http_content_load_fonts()`, and `http_load_file()`.

4.50.2.18 `uint64_t magma_t::core_dump_size_limit`

Definition at line 58 of file global.h.

Referenced by `system_init_core_dumps()`.

Referenced by mail_create_directory(), and mail_message_path().

4.50.2.84 char* magma_t::root_directory

Definition at line 50 of file global.h.

Referenced by config_validate_settings(), and system_change_root_directory().

4.50.2.85 bool_t magma_t::safeguard

Definition at line 139 of file global.h.

4.50.2.86 stringer_t* magma_t::salt

Definition at line 71 of file global.h.

Referenced by auth_legacy().

4.50.2.87 chr_t* magma_t::schema

Definition at line 173 of file global.h.

4.50.2.88 struct { ... } magma_t::secure

Referenced by auth_legacy(), auth_login(), config_validate_settings(), mm_sec_start(), register_business_step1(), register_business_validate_password(), register_data_insert_user(), sess_get(), sess_token(), and st_realloc().

4.50.2.89 uint32_t magma_t::seed_length

Definition at line 164 of file global.h.

4.50.2.90 chr_t* magma_t::selector

Definition at line 152 of file global.h.

Referenced by config_validate_settings(), and dkim_signature_create().

4.50.2.91 stringer_t* magma_t::sender

Definition at line 142 of file global.h.

4.50.2.92 server_t* magma_t::servers[MAGMA_SERVER_INSTANCES]

Definition at line 219 of file global.h.

Referenced by net_listen(), net_trigger(), servers_alloc(), servers_encryption_start(), servers_encryption_stop(), servers_free(), servers_get_by_protocol(), servers_get_by_socket(), servers_get_count_using_port(), servers_network_start(), servers_network_stop(), servers_output_settings(), and servers_validate().

4.50.2.93 uint32_t magma_t::session_timeout

Definition at line 124 of file global.h.

4.50.2.94 stringer_t* magma_t::sessions

Definition at line 73 of file global.h.

Referenced by sess_get(), and sess_token().

4.50.2.95 char* magma_t::signatures

Definition at line 185 of file global.h.

4.50.2.96 stringer_t* magma_t::signet

Definition at line 158 of file global.h.

Referenced by config_validate_settings(), and prime_start().

4.50.2.97 struct { ... } magma_t::smtp

Referenced by config_free(), config_output_value(), config_output_value_generic(), config_validate_settings(), config_value_set(), mail_message_cleanup(), smtp_add_bypass_entry(), smtp_bypass_check(), smtp_check_rbl(), smtp_data(), smtp_ehlo(), smtp_mail_from(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), and smtp_rcpt_to().

4.50.2.98 chr_t* magma_t::socket_path

Definition at line 175 of file global.h.

4.50.2.99 struct { ... } magma_t::spf

Referenced by spf_start(), and spf_stop().

4.50.2.100 chr_t* magma_t::spool

Definition at line 213 of file global.h.

Referenced by config_validate_settings(), spool_path(), and virus_start().

4.50.2.101 bool_t magma_t::stack

Definition at line 90 of file global.h.

Referenced by log_internal().

4.50.2.102 uint32_t magma_t::standard

Definition at line 131 of file global.h.

4.50.2.103 bool_t magma_t::statistics

Definition at line 144 of file global.h.

Referenced by http_response().

4.50.2.104 struct { ... } magma_t::storage

Referenced by imap_append_message(), mail_create_directory(), mail_db_insert_duplicate_message(), mail_db_insert_message(), mail_message_path(), and tank_start().

4.50.2.105 struct { ... } magma_t::system

Referenced by auth_sanitize_username(), color_supported(), con_init_network_buffer(), config_validate_settings(), log_rotate(), log_start(), net_init(), queue_init(), queue_shutdown(), queue_signal(), register_business_step2(), register_data_insert_user(), smtp_bounce(), smtp_client_send_helo(), system_change_root_directory(), system_fork_daemon(), system_init_core_dumps(), system_init_impersonation(), system_init_resource_limits(), and thread_launch().

4.50.2.106 chr_t* magma_t::tank

Definition at line 95 of file global.h.

Referenced by tank_start().

4.50.2.107 chr_t* magma_t::templates

Definition at line 123 of file global.h.

4.50.2.108 uint32_t magma_t::thread_stack_size

Definition at line 53 of file global.h.

Referenced by config_validate_settings(), and thread_launch().

4.50.2.109 bool_t magma_t::time

Definition at line 89 of file global.h.

Referenced by log_internal().

4.50.2.110 uint32_t magma_t::timeout

Definition at line 133 of file global.h.

Referenced by smtp_client_connect().

4.50.2.111 stringer_t* magma_t::tls_redirect

Definition at line 146 of file global.h.

Referenced by http_print_301().

4.50.2.112 `bool_t magma_t::unload`

Definition at line 45 of file global.h.

Referenced by lib_unload().

4.50.2.113 `chr_t* magma_t::user`

Definition at line 171 of file global.h.

4.50.2.114 `struct { ... } magma_t::virus`

Referenced by config_validate_settings(), virus_check(), virus_engine_create(), virus_engine_refresh(), virus_sigs_total(), virus_start(), and virus_stop().

4.50.2.115 `struct { ... } magma_t::web`

Referenced by api_response(), http_print_301(), http_response(), jansson_flags(), json_api_dispatch(), portal_endpoint(), portal_endpoint_error(), portal_endpoint_response(), portal_process(), and portal_upload().

4.50.2.116 `uint32_t magma_t::worker_threads`

Definition at line 54 of file global.h.

Referenced by queue_init(), queue_shutdown(), and queue_signal().

4.50.2.117 `uint32_t magma_t::wrap_line_length`

Definition at line 105 of file global.h.

Referenced by config_validate_settings(), and mail_message_cleanup().

4.51 mail_cache_t Struct Reference

```
#include <mail.h>
```

Data Fields

- uint64_t [messagenum](#)
- [stringer_t](#) * text

4.51.1 Detailed Description

Definition at line 14 of file mail.h.

4.51.2 Field Documentation

4.51.2.1 uint64_t mail_cache_t::messagenum

Definition at line 15 of file mail.h.

Referenced by [mail_cache_get\(\)](#), [mail_cache_reset\(\)](#), and [mail_cache_set\(\)](#).

4.51.2.2 stringer_t* mail_cache_t::text

Definition at line 16 of file mail.h.

Referenced by [mail_cache_destroy\(\)](#), [mail_cache_get\(\)](#), [mail_cache_reset\(\)](#), and [mail_cache_set\(\)](#).

4.52 mail_message_t Struct Reference

```
#include <mail.h>
```

Data Fields

- [placer_t](#) to
- [placer_t](#) date
- [placer_t](#) subject
- [stringer_t](#) * from
- [stringer_t](#) * text
- [mail_mime_t](#) * mime
- [size_t](#) [header_length](#)

4.52.1 Detailed Description

Definition at line 26 of file mail.h.

4.52.2 Field Documentation

4.52.2.1 [placer_t](#) mail_message_t::date

Definition at line 28 of file mail.h.

Referenced by [mail_message\(\)](#).

4.52.2.2 [stringer_t](#)* mail_message_t::from

Definition at line 30 of file mail.h.

Referenced by [mail_destroy\(\)](#), and [mail_message\(\)](#).

4.52.2.3 [size_t](#) mail_message_t::header_length

Definition at line 33 of file mail.h.

Referenced by [mail_load_header\(\)](#), [mail_message\(\)](#), and [portal_message_header\(\)](#).

4.52.2.4 [mail_mime_t](#)* mail_message_t::mime

Definition at line 32 of file mail.h.

Referenced by [imap_fetch_body\(\)](#), [imap_fetch_body_part\(\)](#), [imap_fetch_message\(\)](#), [mail_destroy\(\)](#), [mail_mime_update\(\)](#), [portal_message_attachments\(\)](#), and [portal_message_body\(\)](#).

4.52.2.5 [placer_t](#) mail_message_t::subject

Definition at line 29 of file mail.h.

Referenced by [mail_message\(\)](#).

4.52.2.6 stringer_t* mail_message_t::text

Definition at line 31 of file mail.h.

Referenced by imap_fetch_message(), mail_add_forward_headers(), mail_destroy(), mail_load_header(), mail_load_message(), mail_load_message_top(), mail_message(), mail_mime_update(), mail_modify_part(), mail_signature_add(), pop_retr(), pop_top(), and portal_message_header().

4.52.2.7 placer_t mail_message_t::to

Definition at line 27 of file mail.h.

Referenced by mail_message().

4.53 mail_mime_t Struct Reference

```
#include <mail.h>
```

Data Fields

- [array_t * children](#)
- [stringer_t * boundary](#)
- [uint32_t type](#)
- [uint32_t encoding](#)
- [placer_t header](#)
- [placer_t body](#)
- [placer_t entire](#)

4.53.1 Detailed Description

Definition at line 19 of file mail.h.

4.53.2 Field Documentation

4.53.2.1 `placer_t mail_mime_t::body`

Definition at line 23 of file mail.h.

Referenced by `imap_fetch_body()`, `imap_fetch_bodystructure()`, `imap_fetch_message()`, `mail_mime_part()`, `portal_message_attachments()`, and `portal_message_body()`.

4.53.2.2 `stringer_t* mail_mime_t::boundary`

Definition at line 21 of file mail.h.

Referenced by `mail_mime_free()`, and `mail_mime_part()`.

4.53.2.3 `array_t* mail_mime_t::children`

Definition at line 20 of file mail.h.

Referenced by `imap_fetch_body_part()`, `imap_fetch_bodystructure()`, `mail_mime_free()`, `mail_mime_part()`, `portal_message_attachments()`, and `portal_message_body()`.

4.53.2.4 `uint32_t mail_mime_t::encoding`

Definition at line 22 of file mail.h.

Referenced by `mail_mime_part()`.

4.53.2.5 `placer_t mail_mime_t::entire`

Definition at line 23 of file mail.h.

Referenced by `mail_mime_part()`.

4.53.2.6 placer_t mail_mime_t::header

Definition at line 23 of file mail.h.

Referenced by `imap_fetch_body()`, `imap_fetch_bodystructure()`, `mail_mime_part()`, and `portal_message_attachments()`.

4.53.2.7 uint32_t mail_mime_t::type

Definition at line 22 of file mail.h.

Referenced by `mail_mime_part()`, `portal_message_attachments()`, and `portal_message_body()`.

4.54 mappings_t Struct Reference

```
#include <encodings.h>
```

Data Fields

- struct {
 chr_t characters [32]
 chr_t values [128]
} zbase32
- struct {
 chr_t characters [64]
 chr_t values [128]
} base64
- struct {
 chr_t characters [64]
 chr_t values [128]
} base64_mod

4.54.1 Detailed Description

Definition at line 32 of file encodings.h.

4.54.2 Field Documentation

4.54.2.1 struct { ... } mappings_t::base64

Referenced by base64_decode(), base64_encode(), and base64_encode_wrap().

4.54.2.2 struct { ... } mappings_t::base64_mod

Referenced by base64_decode_mod(), and base64_encode_mod().

4.54.2.3 chr_t mappings_t::characters[64]

Definition at line 34 of file encodings.h.

Referenced by base64_encode(), base64_encode_mod(), base64_encode_wrap(), and zbase32_encode().

4.54.2.4 chr_t mappings_t::values[128] ()

Definition at line 34 of file encodings.h.

Referenced by base64_decode(), base64_decode_mod(), and zbase32_decode().

4.54.2.5 struct { ... } mappings_t::zbase32

Referenced by zbase32_decode(), and zbase32_encode().

4.55 media_type_t Struct Reference

```
#include <mail.h>
```

Data Fields

- [chr_t * extension](#)
- [bool_t bin](#)
- [chr_t * name](#)

4.55.1 Detailed Description

Definition at line 36 of file mail.h.

4.55.2 Field Documentation

4.55.2.1 bool_t media_type_t::bin

Definition at line 38 of file mail.h.

Referenced by mail_mime_encode_part().

4.55.2.2 chr_t* media_type_t::extension

Definition at line 37 of file mail.h.

4.55.2.3 chr_t* media_type_t::name

Definition at line 39 of file mail.h.

Referenced by mail_mime_encode_part().

4.56 meta_stats_tag_t Struct Reference

```
#include <meta.h>
```

Data Fields

- `uint64_t` [count](#)
- `stringer_t *` [tag](#)

4.56.1 Detailed Description

Definition at line 16 of file `meta.h`.

4.56.2 Field Documentation

4.56.2.1 `uint64_t` `meta_stats_tag_t::count`

Definition at line 17 of file `meta.h`.

Referenced by `meta_folders_stats_tags()`, and `portal_endpoint_folders_tags()`.

4.56.2.2 `stringer_t *` `meta_stats_tag_t::tag`

Definition at line 18 of file `meta.h`.

Referenced by `meta_folder_stats_tag_alloc()`, and `portal_endpoint_folders_tags()`.

4.57 multi_t Struct Reference

```
#include <strings.h>
```

Data Fields

- [M_TYPE](#) type

 - float [fl](#)
 - double [dbl](#)
- [val](#)

4.57.1 Detailed Description

Definition at line 203 of file strings.h.

4.57.2 Field Documentation

4.57.2.1 bool_t multi_t::binary

Definition at line 206 of file strings.h.

Referenced by [cache_set_value\(\)](#), [cmp_mt_mt\(\)](#), [config_value_set\(\)](#), [ident_mt_mt\(\)](#), [mt_dupe\(\)](#), [mt_get_char\(\)](#), [relay_set_value\(\)](#), and [servers_set_value\(\)](#).

4.57.2.2 void* multi_t::bl

Definition at line 207 of file strings.h.

Referenced by [cache_output_help\(\)](#), [config_output_help\(\)](#), [mt_get_char\(\)](#), [mt_is_empty\(\)](#), [relay_output_help\(\)](#), and [servers_output_help\(\)](#).

4.57.2.3 double multi_t::dbl

Definition at line 219 of file strings.h.

Referenced by [cmp_mt_mt\(\)](#), [ident_mt_mt\(\)](#), [mt_dupe\(\)](#), [mt_get_char\(\)](#), and [mt_get_number\(\)](#).

4.57.2.4 float multi_t::fl

Definition at line 218 of file strings.h.

Referenced by `cmp_mt_mt()`, `ident_mt_mt()`, `mt_dupe()`, `mt_get_char()`, and `mt_get_number()`.

4.57.2.5 `int16_t multi_t::i16`

Definition at line 215 of file `strings.h`.

Referenced by `cache_validate()`, `cmp_mt_mt()`, `ident_mt_mt()`, `mt_dupe()`, `mt_get_char()`, `mt_get_number()`, `relay_validate()`, and `servers_validate()`.

4.57.2.6 `int32_t multi_t::i32`

Definition at line 216 of file `strings.h`.

Referenced by `cache_set_value()`, `cache_validate()`, `cmp_mt_mt()`, `config_value_set()`, `ident_mt_mt()`, `mt_dupe()`, `mt_get_char()`, `mt_get_number()`, `relay_set_value()`, `relay_validate()`, `servers_set_value()`, and `servers_validate()`.

4.57.2.7 `int64_t multi_t::i64`

Definition at line 217 of file `strings.h`.

Referenced by `cache_set_value()`, `cache_validate()`, `cmp_mt_mt()`, `config_value_set()`, `ident_mt_mt()`, `mt_dupe()`, `mt_get_char()`, `mt_get_number()`, `relay_set_value()`, `relay_validate()`, `servers_set_value()`, and `servers_validate()`.

4.57.2.8 `int8_t multi_t::i8`

Definition at line 214 of file `strings.h`.

Referenced by `cache_set_value()`, `cache_validate()`, `cmp_mt_mt()`, `config_value_set()`, `ident_mt_mt()`, `mt_dupe()`, `mt_get_char()`, `mt_get_number()`, `relay_set_value()`, `relay_validate()`, `servers_set_value()`, and `servers_validate()`.

4.57.2.9 `char* multi_t::ns`

Definition at line 208 of file `strings.h`.

Referenced by `cache_set_value()`, `cmp_mt_mt()`, `config_value_set()`, `ident_mt_mt()`, `mt_dupe()`, `mt_free()`, `mt_get_char()`, `mt_get_length()`, `mt_is_empty()`, `relay_set_value()`, and `servers_set_value()`.

4.57.2.10 `stringer_t* multi_t::st`

Definition at line 209 of file `strings.h`.

Referenced by `cache_set_value()`, `cmp_mt_mt()`, `config_load_cmdline_settings()`, `config_load_file_settings()`, `config_value_set()`, `contact_details_fetch()`, `contact_edit()`, `http_data_value_parse()`, `http_load_file()`, `http_parse_header()`, `ident_mt_mt()`, `meta_folders_stats_tags()`, `mt_dupe()`, `mt_free()`, `mt_get_char()`, `mt_get_length()`, `mt_is_empty()`, `nvp_parse()`, `relay_set_value()`, `servers_set_value()`, `teacher_add_cookie()`, `user_config_edit()`, `user_config_fetch()`, and `warehouse_fetch_domains()`.

4.57.2.11 `M_TYPE multi_t::type`

Definition at line 204 of file `strings.h`.

Referenced by `cache_free()`, `cache_output_settings()`, `cache_set_value()`, `cache_validate()`, `cmp_mt_mt()`, `config_free()`, `config_output_value()`, `config_value_set()`, `ident_mt_mt()`, `imap_message_copier()`, `meta_data_fetch_all_tags()`, `meta_data_fetch_folders()`, `meta_data_fetch_messages()`, `mt_dupe()`, `mt_free()`, `mt_get_char()`, `mt_get_length()`, `mt_get_null()`, `mt_get_number()`, `mt_get_type()`, `mt_is_empty()`, `mt_is_number()`, `mt_set_type()`, `relay_free()`, `relay_output_settings()`, `relay_set_value()`, `relay_validate()`, `servers_free()`, `servers_output_settings()`, `servers_set_value()`, `servers_validate()`, `signature_tree_add()`, and `smtp_add_bypass_entry()`.

4.57.2.12 uint16_t multi_t::u16

Definition at line 211 of file strings.h.

Referenced by cache_set_value(), cache_validate(), cmp_mt_mt(), config_value_set(), ident_mt_mt(), mt_dupe(), mt_get_char(), mt_get_number(), relay_set_value(), relay_validate(), servers_set_value(), and servers_validate().

4.57.2.13 uint32_t multi_t::u32

Definition at line 212 of file strings.h.

Referenced by cache_set_value(), cache_validate(), cmp_mt_mt(), config_value_set(), ident_mt_mt(), mt_dupe(), mt_get_char(), mt_get_number(), relay_set_value(), relay_validate(), servers_set_value(), and servers_validate().

4.57.2.14 uint64_t multi_t::u64

Definition at line 213 of file strings.h.

Referenced by cache_set_value(), cache_validate(), cmp_mt_mt(), config_value_set(), contact_folder_create(), contact_move(), contacts_fetch(), http_content_load_fonts(), ident_mt_mt(), imap_append_message(), imap_duplicate_messages(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_message_copier(), imap_narrow_folders(), imap_narrow_messages(), imap_search_messages(), magma_folder_fetch(), message_folder_create(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_messages_copier(), meta_messages_mover(), mt_dupe(), mt_get_char(), mt_get_number(), pop_session_destroy(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_load(), portal_endpoint_contacts_remove(), portal_endpoint_messages_compose(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_load(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), portal_endpoint_messages_tag(), portal_get_upload_attachment(), portal_parse_json_str_array(), register_data_fetch_blocklist(), relay_set_value(), relay_validate(), servers_set_value(), servers_validate(), sess_create(), sess_get(), signature_tree_add(), smtp_add_bypass_entry(), smtp_fetch_inbound(), and warehouse_fetch_patterns().

4.57.2.15 uint8_t multi_t::u8

Definition at line 210 of file strings.h.

Referenced by cache_set_value(), cache_validate(), cmp_mt_mt(), config_value_set(), ident_mt_mt(), mt_dupe(), mt_get_char(), mt_get_number(), relay_set_value(), relay_validate(), servers_set_value(), and servers_validate().

4.59.1 Detailed Description

Definition at line 13 of file formats.h.

4.59.2 Member Function Documentation

4.59.2.1 `struct nvp_t::__attribute__ ((packed))` [`inline`, `read`]

Definition at line 15 of file formats.h.

References comment.

4.59.3 Field Documentation

4.59.3.1 `MAGMA_INDEX nvp_t::options`

Definition at line 14 of file formats.h.

4.59.3.2 `inx_t* nvp_t::pairs`

Definition at line 18 of file formats.h.

Referenced by `config_load_cmdline_settings()`, `config_load_file_settings()`, `nvp_alloc()`, `nvp_free()`, and `nvp_parse()`.

4.59.3.3 `nvp_t::tokens`

Definition at line 17 of file formats.h.

Referenced by `nvp_alloc()`, and `nvp_parse()`.

4.60 object_cache_t Struct Reference

```
#include <objects.h>
```

Data Fields

- [inx_t](#) * meta
- [inx_t](#) * sessions

4.60.1 Detailed Description

Definition at line 30 of file objects.h.

4.60.2 Field Documentation

4.60.2.1 inx_t* object_cache_t::meta

Definition at line 31 of file objects.h.

Referenced by meta_inx_find(), meta_inx_remove(), obj_cache_prune(), obj_cache_start(), and obj_cache_stop().

4.60.2.2 inx_t * object_cache_t::sessions

Definition at line 31 of file objects.h.

Referenced by obj_cache_prune(), obj_cache_start(), obj_cache_stop(), sess_create(), and sess_get().

4.61 object_chunk Struct Reference

```
#include <crypto.h>
```

Data Fields

- struct [object_chunk](#) * [next](#)
- [dmime_chunk_type_t](#) [type](#)
- unsigned char [flags](#)
- size_t [data_size](#)
- unsigned char * [data](#)

4.61.1 Detailed Description

Definition at line 51 of file `crypto.h`.

4.61.2 Field Documentation

4.61.2.1 unsigned char* object_chunk::data

Definition at line 56 of file `crypto.h`.

4.61.2.2 size_t object_chunk::data_size

Definition at line 55 of file `crypto.h`.

4.61.2.3 unsigned char object_chunk::flags

Definition at line 54 of file `crypto.h`.

4.61.2.4 struct object_chunk* object_chunk::next [read]

Definition at line 52 of file `crypto.h`.

4.61.2.5 dmime_chunk_type_t object_chunk::type

Definition at line 53 of file `crypto.h`.

4.62 packedelem32_t Union Reference

```
#include <curve25519-donna-sse2.h>
```

Data Fields

- `uint32_t u` [4]
- `xmmi v`

4.62.1 Detailed Description

Definition at line 16 of file `curve25519-donna-sse2.h`.

4.62.2 Field Documentation

4.62.2.1 `uint32_t packedelem32_t::u[4]`

Definition at line 17 of file `curve25519-donna-sse2.h`.

4.62.2.2 `xmmi packedelem32_t::v`

Definition at line 18 of file `curve25519-donna-sse2.h`.

4.63 packedelem64_t Union Reference

```
#include <curve25519-donna-sse2.h>
```

Data Fields

- uint64_t [u](#) [2]
- [xmml](#) [v](#)

4.63.1 Detailed Description

Definition at line 21 of file curve25519-donna-sse2.h.

4.63.2 Field Documentation

4.63.2.1 uint64_t packedelem64_t::u[2]

Definition at line 22 of file curve25519-donna-sse2.h.

4.63.2.2 xmml packedelem64_t::v

Definition at line 23 of file curve25519-donna-sse2.h.

4.64 packedelem8_t Union Reference

```
#include <curve25519-donna-sse2.h>
```

Data Fields

- unsigned char [u](#) [16]
- [xmml](#) [v](#)

4.64.1 Detailed Description

Definition at line 11 of file curve25519-donna-sse2.h.

4.64.2 Field Documentation

4.64.2.1 unsigned char packedelem8_t::u[16]

Definition at line 12 of file curve25519-donna-sse2.h.

4.64.2.2 xmml packedelem8_t::v

Definition at line 13 of file curve25519-donna-sse2.h.

4.65 queue_t Struct Reference

Public Member Functions

- void(* [requeue](#) (void *[data](#)))(*)

Data Fields

- void(* [function](#))(void *[data](#))
- void(*)(*)* [data](#)
- struct [queue_t](#) * [next](#)

4.65.1 Detailed Description

Definition at line 10 of file queue.c.

4.65.2 Member Function Documentation

4.65.2.1 void(* queue_t::requeue (void * *data*)

Referenced by dequeue(), and requeue().

4.65.3 Field Documentation

4.65.3.1 void(*)(*) * queue_t::data

Definition at line 11 of file queue.c.

Referenced by dequeue(), and requeue().

4.65.3.2 void(* queue_t::function)(void **data*)

Referenced by dequeue(), and requeue().

4.65.3.3 struct queue_t* queue_t::next [\[read\]](#)

Definition at line 12 of file queue.c.

Referenced by dequeue(), and requeue().

4.66 random_data_t Struct Reference

Data Fields

- unsigned char [sk](#) [32]
- unsigned char [m](#) [128]

4.66.1 Detailed Description

Definition at line 116 of file fuzz-ed25519.c.

4.66.2 Field Documentation

4.66.2.1 unsigned char random_data_t::m[128]

Definition at line 118 of file fuzz-ed25519.c.

Referenced by `main()`.

4.66.2.2 unsigned char random_data_t::sk[32]

Definition at line 117 of file fuzz-ed25519.c.

Referenced by `main()`.

4.67 register_session_t Struct Reference

```
#include <register.h>
```

Data Fields

- uint64_t [usernum](#)
- uint16_t [plan](#)
- [stringer_t](#) * [username](#)
- [stringer_t](#) * [password](#)
- [stringer_t](#) * [hvf_value](#)
- [stringer_t](#) * [hvf_input](#)
- [stringer_t](#) * [name](#)

4.67.1 Detailed Description

Definition at line 17 of file register.h.

4.67.2 Field Documentation

4.67.2.1 [stringer_t](#) * [register_session_t::hvf_input](#)

Definition at line 20 of file register.h.

Referenced by [register_business_step1\(\)](#), [register_session_cache\(\)](#), [register_session_free\(\)](#), and [register_session_get\(\)](#).

4.67.2.2 [stringer_t](#) * [register_session_t::hvf_value](#)

Definition at line 20 of file register.h.

Referenced by [register_business_step1\(\)](#), [register_print_captcha\(\)](#), [register_session_cache\(\)](#), [register_session_free\(\)](#), and [register_session_get\(\)](#).

4.67.2.3 [stringer_t](#) * [register_session_t::name](#)

Definition at line 20 of file register.h.

Referenced by [register_print_step1\(\)](#), [register_print_step2\(\)](#), [register_session_cache\(\)](#), [register_session_free\(\)](#), [register_session_generate\(\)](#), and [register_session_get\(\)](#).

4.67.2.4 [stringer_t](#) * [register_session_t::password](#)

Definition at line 20 of file register.h.

Referenced by [register_business_step1\(\)](#), [register_business_step2\(\)](#), [register_session_cache\(\)](#), [register_session_free\(\)](#), and [register_session_get\(\)](#).

4.67.2.5 [uint16_t](#) [register_session_t::plan](#)

Definition at line 19 of file register.h.

Referenced by [register_business_step2\(\)](#), [register_session_cache\(\)](#), and [register_session_get\(\)](#).

4.67.2.6 stringer_t* register_session_t::username

Definition at line 20 of file register.h.

Referenced by register_business_step1(), register_business_step2(), register_print_step1(), register_session_cache(), register_session_free(), and register_session_get().

4.67.2.7 uint64_t register_session_t::usernum

Definition at line 18 of file register.h.

Referenced by register_business_step2(), register_process(), register_session_cache(), and register_session_get().

4.68 relay_keys_t Struct Reference

```
#include <relay.h>
```

Data Fields

- [size_t offset](#)
- [multi_t norm](#)
- [chr_t * name](#)
- [chr_t * description](#)
- [bool_t required](#)

4.68.1 Detailed Description

Definition at line 11 of file relay.h.

4.68.2 Field Documentation

4.68.2.1 chr_t* relay_keys_t::description

Definition at line 15 of file relay.h.

4.68.2.2 chr_t* relay_keys_t::name

Definition at line 14 of file relay.h.

Referenced by relay_set_value().

4.68.2.3 multi_t relay_keys_t::norm

Definition at line 13 of file relay.h.

Referenced by relay_free(), relay_output_help(), relay_output_settings(), relay_set_value(), and relay_validate().

4.68.2.4 size_t relay_keys_t::offset

Definition at line 12 of file relay.h.

Referenced by relay_free(), relay_output_settings(), relay_set_value(), and relay_validate().

4.68.2.5 bool_t relay_keys_t::required

Definition at line 16 of file relay.h.

Referenced by relay_output_help().

4.69 relay_t Struct Reference

```
#include <relay.h>
```

Data Fields

- [bool_t secure](#)
- [bool_t premium](#)
- [chr_t * name](#)
- [uint32_t port](#)

4.69.1 Detailed Description

Definition at line 19 of file relay.h.

4.69.2 Field Documentation

4.69.2.1 chr_t* relay_t::name

Definition at line 22 of file relay.h.

Referenced by smtp_client_connect().

4.69.2.2 uint32_t relay_t::port

Definition at line 23 of file relay.h.

Referenced by smtp_client_connect().

4.69.2.3 bool_t relay_t::premium

Definition at line 21 of file relay.h.

4.69.2.4 bool_t relay_t::secure

Definition at line 20 of file relay.h.

Referenced by smtp_client_connect().

4.70 server_config_t Struct Reference

```
#include <servers.h>
```

Data Fields

- SSL_CTX * [tls_ctx](#)
- char * [certificate](#)
- int [tls_sd](#)
- int [normal_sd](#)
- [stringer_t](#) * [name](#)
- [stringer_t](#) * [spam](#)
- [stringer_t](#) * [domain](#)
- [stringer_t](#) * [banner](#)
- unsigned [tls_port](#)
- unsigned [tcp_port](#)
- unsigned [listen_queue](#)
- unsigned [socket_timeout](#)
- unsigned [bad_command_cutoff](#)
- unsigned [bad_command_delay](#)
- struct [server_config_t](#) * [next](#)

4.70.1 Detailed Description

Definition at line 58 of file servers.h.

4.70.2 Field Documentation

4.70.2.1 unsigned server_config_t::bad_command_cutoff

Definition at line 63 of file servers.h.

4.70.2.2 unsigned server_config_t::bad_command_delay

Definition at line 63 of file servers.h.

4.70.2.3 stringer_t * server_config_t::banner

Definition at line 62 of file servers.h.

4.70.2.4 char* server_config_t::certificate

Definition at line 60 of file servers.h.

4.70.2.5 stringer_t * server_config_t::domain

Definition at line 62 of file servers.h.

4.70.2.6 unsigned server_config_t::listen_queue

Definition at line 63 of file servers.h.

4.70.2.7 stringer_t* server_config_t::name

Definition at line 62 of file servers.h.

4.70.2.8 struct server_config_t* server_config_t::next [read]

Definition at line 64 of file servers.h.

4.70.2.9 int server_config_t::normal_sd

Definition at line 61 of file servers.h.

4.70.2.10 unsigned server_config_t::socket_timeout

Definition at line 63 of file servers.h.

4.70.2.11 stringer_t * server_config_t::spam

Definition at line 62 of file servers.h.

4.70.2.12 unsigned server_config_t::tcp_port

Definition at line 63 of file servers.h.

4.70.2.13 SSL_CTX* server_config_t::tls_ctx

Definition at line 59 of file servers.h.

4.70.2.14 unsigned server_config_t::tls_port

Definition at line 63 of file servers.h.

4.70.2.15 int server_config_t::tls_sd

Definition at line 61 of file servers.h.

4.71 server_keys_t Struct Reference

```
#include <servers.h>
```

Data Fields

- [size_t offset](#)
- [multi_t norm](#)
- [chr_t * name](#)
- [chr_t * description](#)
- [bool_t required](#)

4.71.1 Detailed Description

Definition at line 27 of file servers.h.

4.71.2 Field Documentation

4.71.2.1 chr_t* server_keys_t::description

Definition at line 31 of file servers.h.

4.71.2.2 chr_t* server_keys_t::name

Definition at line 30 of file servers.h.

Referenced by servers_set_value().

4.71.2.3 multi_t server_keys_t::norm

Definition at line 29 of file servers.h.

Referenced by servers_free(), servers_output_help(), servers_output_settings(), servers_set_value(), and servers_validate().

4.71.2.4 size_t server_keys_t::offset

Definition at line 28 of file servers.h.

Referenced by servers_free(), servers_output_settings(), servers_set_value(), and servers_validate().

4.71.2.5 bool_t server_keys_t::required

Definition at line 32 of file servers.h.

Referenced by servers_output_help().

4.72 server_t Struct Reference

```
#include <servers.h>
```

Data Fields

- struct {
 SSL_CTX * context
 chr_t * certificate
} tls
- struct {
 int sockd
 bool_t ipv6
 uint32_t port
 uint32_t timeout
 uint32_t listen_queue
 M_PORT type
} network
- struct {
 uint32_t delay
 uint32_t cutoff
} violations
- bool_t enabled
- stringer_t * name
- stringer_t * domain
- M_PROTOCOL protocol

4.72.1 Detailed Description

Definition at line 35 of file servers.h.

4.72.2 Field Documentation

4.72.2.1 chr_t* server_t::certificate

Definition at line 38 of file servers.h.

Referenced by servers_encryption_start(), servers_validate(), and tls_server_create().

4.72.2.2 SSL_CTX* server_t::context

Definition at line 37 of file servers.h.

Referenced by protocol_process(), servers_encryption_stop(), tls_server_alloc(), tls_server_create(), and tls_server_destroy().

4.72.2.3 uint32_t server_t::cutoff

Definition at line 50 of file servers.h.

4.72.2.4 uint32_t server_t::delay

Definition at line 49 of file servers.h.

4.72.2.5 stringer_t * server_t::domain

Definition at line 53 of file servers.h.

Referenced by mail_build_signature(), and servers_network_start().

4.72.2.6 bool_t server_t::enabled

Definition at line 52 of file servers.h.

Referenced by net_listen(), net_trigger(), servers_encryption_start(), servers_encryption_stop(), servers_get_by_protocol(), servers_network_start(), and servers_network_stop().

4.72.2.7 bool_t server_t::ipv6

Definition at line 42 of file servers.h.

Referenced by net_init().

4.72.2.8 uint32_t server_t::listen_queue

Definition at line 45 of file servers.h.

Referenced by net_init().

4.72.2.9 stringer_t* server_t::name

Definition at line 53 of file servers.h.

Referenced by servers_network_start().

4.72.2.10 struct { ... } server_t::network

Referenced by con_init(), net_accept(), net_init(), net_listen(), net_shutdown(), net_trigger(), protocol_process(), servers_alloc(), servers_get_by_protocol(), servers_get_by_socket(), servers_get_count_using_port(), servers_network_stop(), and servers_validate().

4.72.2.11 uint32_t server_t::port

Definition at line 43 of file servers.h.

Referenced by net_init(), net_trigger(), servers_get_count_using_port(), and servers_validate().

4.72.2.12 M_PROTOCOL server_t::protocol

Definition at line 54 of file servers.h.

Referenced by servers_encryption_start(), servers_get_by_protocol(), and servers_validate().

4.72.2.13 int server_t::sockd

Definition at line 41 of file servers.h.

Referenced by con_init(), net_accept(), net_init(), net_listen(), net_shutdown(), net_trigger(), servers_alloc(), servers_get_by_socket(), and servers_network_stop().

4.72.2.14 uint32_t server_t::timeout

Definition at line 44 of file servers.h.

Referenced by protocol_process().

4.72.2.15 struct { ... } server_t::tls

Referenced by protocol_process(), servers_encryption_start(), servers_encryption_stop(), servers_validate(), tls_server_alloc(), tls_server_create(), and tls_server_destroy().

4.72.2.16 M_PORT server_t::type

Definition at line 46 of file servers.h.

Referenced by protocol_process(), servers_get_by_protocol(), and servers_validate().

4.72.2.17 struct { ... } server_t::violations

4.73 sha_databuf_t Struct Reference

```
#include <misc.h>
```

Data Fields

- void * [data](#)
- size_t [len](#)

4.73.1 Detailed Description

Definition at line 36 of file misc.h.

4.73.2 Field Documentation

4.73.2.1 void* sha_databuf_t::data

Definition at line 37 of file misc.h.

4.73.2.2 size_t sha_databuf_t::len

Definition at line 38 of file misc.h.

4.74 `signet_field_key_t` Struct Reference

```
#include <common.h>
```

Data Fields

- unsigned int `required`
- unsigned int `unique`
- unsigned char `bytes_name_size`
- unsigned char `bytes_data_size`
- uint32_t `data_size`
- `field_data_t` `data_type`
- const char * `name`
- const char * `description`

4.74.1 Detailed Description

Definition at line 150 of file `common.h`.

4.74.2 Field Documentation

4.74.2.1 unsigned char `signet_field_key_t::bytes_data_size`

Number of bytes for this

Definition at line 156 of file `common.h`.

4.74.2.2 unsigned char `signet_field_key_t::bytes_name_size`

Is this a defined field

Definition at line 155 of file `common.h`.

4.74.2.3 uint32_t `signet_field_key_t::data_size`

`data_size = 0` indicates the size being variable

Definition at line 157 of file `common.h`.

4.74.2.4 `field_data_t` `signet_field_key_t::data_type`

Dump format for the field

Definition at line 159 of file `common.h`.

4.74.2.5 const char* `signet_field_key_t::description`

field type description

Definition at line 162 of file `common.h`.

4.74.2.6 `const char* signet_field_key_t::name`

Definition at line 161 of file `common.h`.

4.74.2.7 `unsigned int signet_field_key_t::required`

is this field required

Definition at line 152 of file `common.h`.

4.74.2.8 `unsigned int signet_field_key_t::unique`

can there be multiple fields of this identifier

Definition at line 153 of file `common.h`.

4.75 `signet_field_t` Struct Reference

Data Fields

- const `signet_t * signet`
- `signet_field_key_t * key`
- unsigned char `name_size`
- unsigned int `data_size`
- unsigned int `id_offset`
- unsigned int `name_offset`
- unsigned int `data_offset`
- struct `signet_field_t * next`

4.75.1 Detailed Description

A signet field index structure for temporary convenience organization of field data

Definition at line 7 of file `signet.c`.

4.75.2 Field Documentation

4.75.2.1 unsigned int `signet_field_t::data_offset`

Definition at line 16 of file `signet.c`.

4.75.2.2 unsigned int `signet_field_t::data_size`

Definition at line 12 of file `signet.c`.

4.75.2.3 unsigned int `signet_field_t::id_offset`

Definition at line 14 of file `signet.c`.

4.75.2.4 `signet_field_key_t*` `signet_field_t::key`

Definition at line 10 of file `signet.c`.

4.75.2.5 unsigned int `signet_field_t::name_offset`

Definition at line 15 of file `signet.c`.

4.75.2.6 unsigned char `signet_field_t::name_size`

Definition at line 11 of file `signet.c`.

4.75.2.7 struct `signet_field_t*` `signet_field_t::next` `[read]`

Definition at line 18 of file `signet.c`.

4.75.2.8 const signet_t* signet_field_t::signet

Definition at line 9 of file signet.c.

4.76 `signet_t` Struct Reference

```
#include <signet.h>
```

Data Fields

- [signet_type_t](#) type
- [uint32_t](#) [fields](#) [256]
- [uint32_t](#) [size](#)
- unsigned char * [data](#)

4.76.1 Detailed Description

Definition at line 27 of file `signet.h`.

4.76.2 Field Documentation

4.76.2.1 `unsigned char* signet_t::data`

Definition at line 32 of file `signet.h`.

4.76.2.2 `uint32_t signet_t::fields[256]`

Each index corresponds to a different field type identifier. The value of `fields[index]` is the byte directly after the first occurrence of the corresponding field type identifier. If `fields[index]` is 0 it means that the corresponding field type identifier occurred 0 times.

Definition at line 29 of file `signet.h`.

4.76.2.3 `uint32_t signet_t::size`

Combined length of all the fields

Definition at line 31 of file `signet.h`.

4.76.2.4 `signet_type_t signet_t::type`

Definition at line 28 of file `signet.h`.

4.77 smtp_inbound_filter_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- uint64_t [foldernum](#)
- uint64_t [rulenum](#)
- unsigned [location](#)
- unsigned [type](#)
- unsigned [action](#)
- [stringer_t](#) * [field](#)
- [stringer_t](#) * [label](#)
- [stringer_t](#) * [expression](#)

4.77.1 Detailed Description

Definition at line 75 of file smtp.h.

4.77.2 Field Documentation

4.77.2.1 unsigned smtp_inbound_filter_t::action

Definition at line 77 of file smtp.h.

Referenced by [smtp_fetch_inbound\(\)](#).

4.77.2.2 stringer_t * smtp_inbound_filter_t::expression

Definition at line 78 of file smtp.h.

Referenced by [smtp_fetch_inbound\(\)](#), and [smtp_list_free_filter\(\)](#).

4.77.2.3 stringer_t * smtp_inbound_filter_t::field

Definition at line 78 of file smtp.h.

Referenced by [smtp_fetch_inbound\(\)](#), and [smtp_list_free_filter\(\)](#).

4.77.2.4 uint64_t smtp_inbound_filter_t::foldernum

Definition at line 76 of file smtp.h.

Referenced by [smtp_fetch_inbound\(\)](#).

4.77.2.5 stringer_t * smtp_inbound_filter_t::label

Definition at line 78 of file smtp.h.

Referenced by [smtp_fetch_inbound\(\)](#), and [smtp_list_free_filter\(\)](#).

4.77.2.6 unsigned smtp_inbound_filter_t::location

Definition at line 77 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.77.2.7 uint64_t smtp_inbound_filter_t::rulenum

Definition at line 76 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.77.2.8 unsigned smtp_inbound_filter_t::type

Definition at line 77 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.78.1 Detailed Description

Definition at line 82 of file smtp.h.

4.78.2 Field Documentation

4.78.2.1 `stringer_t * smtp_inbound_prefs_t::address`

Definition at line 86 of file smtp.h.

Referenced by `smtp_fetch_inbound()`, and `smtp_free_inbound()`.

4.78.2.2 `uint64_t smtp_inbound_prefs_t::autoreply`

Definition at line 88 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.78.2.3 `int_t smtp_inbound_prefs_t::bounces`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_update_receive_stats()`.

4.78.2.4 `uint32_t smtp_inbound_prefs_t::daily_recv_limit`

Definition at line 87 of file smtp.h.

Referenced by `smtp_check_receive_quota()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.5 `uint32_t smtp_inbound_prefs_t::daily_recv_limit_ip`

Definition at line 87 of file smtp.h.

Referenced by `smtp_check_receive_quota()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.6 `int_t smtp_inbound_prefs_t::dkim`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.78.2.7 `int_t smtp_inbound_prefs_t::dkimaction`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.78.2.8 `stringer_t * smtp_inbound_prefs_t::domain`

Definition at line 86 of file smtp.h.

Referenced by `smtp_fetch_inbound()`, and `smtp_free_inbound()`.

4.78.2.9 `inx_t* smtp_inbound_prefs_t::filters`

Definition at line 91 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_check_filters()`, `smtp_fetch_inbound()`, and `smtp_free_inbound()`.

4.78.2.10 uint64_t smtp_inbound_prefs_t::foldernum

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_filters(), and smtp_store_message().

4.78.2.11 stringer_t * smtp_inbound_prefs_t::forwarded

Definition at line 86 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), smtp_free_inbound(), and smtp_rcpt_to().

4.78.2.12 int_t smtp_inbound_prefs_t::greylist

Definition at line 89 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_rcpt_to().

4.78.2.13 uint32_t smtp_inbound_prefs_t::greytime

Definition at line 87 of file smtp.h.

Referenced by smtp_check_greylist(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.78.2.14 uint64_t smtp_inbound_prefs_t::inbox

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.78.2.15 uint32_t smtp_inbound_prefs_t::local_size

Definition at line 87 of file smtp.h.

4.78.2.16 int_t smtp_inbound_prefs_t::mark

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_filters(), and smtp_store_message().

4.78.2.17 uint64_t smtp_inbound_prefs_t::messagenum

Definition at line 88 of file smtp.h.

Referenced by smtp_store_message().

4.78.2.18 struct smtp_inbound_prefs_t * smtp_inbound_prefs_t::next [read]

Definition at line 92 of file smtp.h.

Referenced by mail_add_required_headers(), smtp_add_inbound(), smtp_bounce(), smtp_check_duplicate_recipient(), smtp_data_inbound(), and smtp_free_inbound().

4.78.2.19 `int_t smtp_inbound_prefs_t::outcome`

Definition at line 83 of file smtp.h.

Referenced by `smtp_bounce()`, and `smtp_data_inbound()`.

4.78.2.20 `int_t smtp_inbound_prefs_t::overquota`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.21 `int_t smtp_inbound_prefs_t::phish`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.78.2.22 `int_t smtp_inbound_prefs_t::phishaction`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.78.2.23 `uint64_t smtp_inbound_prefs_t::quota`

Definition at line 88 of file smtp.h.

Referenced by `smtp_fetch_inbound()`, and `smtp_rollout()`.

4.78.2.24 `int_t smtp_inbound_prefs_t::rbl`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.25 `int_t smtp_inbound_prefs_t::rblaction`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.26 `stringer_t* smtp_inbound_prefs_t::rcptto`

Definition at line 86 of file smtp.h.

Referenced by `mail_add_inbound_headers()`, `mail_add_required_headers()`, `smtp_accept_message()`, `smtp_bounce()`, `smtp_fetch_inbound()`, `smtp_free_inbound()`, and `smtp_rcpt_to()`.

4.78.2.27 `size_t smtp_inbound_prefs_t::recv_size_limit`

Definition at line 85 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.28 int_t smtp_inbound_prefs_t::rollout

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.78.2.29 int_t smtp_inbound_prefs_t::secure

Definition at line 89 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.78.2.30 prime_t* smtp_inbound_prefs_t::signet

Definition at line 84 of file smtp.h.

Referenced by smtp_fetch_inbound(), smtp_free_inbound(), and smtp_store_message().

4.78.2.31 uint64_t smtp_inbound_prefs_t::signum

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_store_message(), and smtp_store_spamsig().

4.78.2.32 int_t smtp_inbound_prefs_t::spam

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.78.2.33 int_t smtp_inbound_prefs_t::spam_checked

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message().

4.78.2.34 int_t smtp_inbound_prefs_t::spamaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.78.2.35 uint64_t smtp_inbound_prefs_t::spamkey

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_store_message(), and smtp_store_spamsig().

4.78.2.36 stringer_t * smtp_inbound_prefs_t::spamsig

Definition at line 86 of file smtp.h.

Referenced by smtp_accept_message(), smtp_free_inbound(), and smtp_insert_spamsig().

4.78.2.37 `int_t smtp_inbound_prefs_t::spf`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.38 `int_t smtp_inbound_prefs_t::spfaction`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_fetch_inbound()`, and `smtp_rcpt_to()`.

4.78.2.39 `uint64_t smtp_inbound_prefs_t::stor_size`

Definition at line 88 of file smtp.h.

Referenced by `smtp_fetch_inbound()`, and `smtp_rollout()`.

4.78.2.40 `uint64_t smtp_inbound_prefs_t::usernum`

Definition at line 88 of file smtp.h.

Referenced by `smtp_accept_message()`, `smtp_check_duplicate_recipient()`, `smtp_check_filters()`, `smtp_check_greylist()`, `smtp_check_receive_quota()`, `smtp_fetch_inbound()`, `smtp_insert_spamsig()`, `smtp_rcpt_to()`, `smtp_rollout()`, `smtp_store_message()`, and `smtp_update_receive_stats()`.

4.78.2.41 `int_t smtp_inbound_prefs_t::virus`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.78.2.42 `int_t smtp_inbound_prefs_t::virusaction`

Definition at line 89 of file smtp.h.

Referenced by `smtp_accept_message()`, and `smtp_fetch_inbound()`.

4.79 smtp_message_t Struct Reference

```
#include <smtp.h>
```

Data Fields

4.82.1 Detailed Description

Definition at line 104 of file smtp.h.

4.82.2 Field Documentation

4.82.2.1 bool_t smtp_session_t::authenticated

Definition at line 107 of file smtp.h.

4.82.2.2 bool_t smtp_session_t::bypass

Definition at line 130 of file smtp.h.

4.82.2.3 struct { ... } smtp_session_t::checked

4.82.2.4 int_t smtp_session_t::dkim

Definition at line 122 of file smtp.h.

4.82.2.5 bool_t smtp_session_t::esmtp

Definition at line 105 of file smtp.h.

4.82.2.6 stringer_t* smtp_session_t::helo

Definition at line 114 of file smtp.h.

4.82.2.7 smtp_inbound_prefs_t* smtp_session_t::in_prefs

Definition at line 127 of file smtp.h.

4.82.2.8 uint32_t smtp_session_t::ip_address_v4

Definition at line 117 of file smtp.h.

4.82.2.9 stringer_t* smtp_session_t::mailfrom

Definition at line 115 of file smtp.h.

4.82.2.10 size_t smtp_session_t::max_length

Definition at line 110 of file smtp.h.

4.82.2.11 smtp_message_t* smtp_session_t::message

Definition at line 126 of file smtp.h.

4.82.2.12 size_t smtp_session_t::num_recipients

Definition at line 111 of file smtp.h.

4.82.2.13 smtp_outbound_prefs_t* smtp_session_t::out_prefs

Definition at line 128 of file smtp.h.

4.82.2.14 int_t smtp_session_t::rbl

Definition at line 120 of file smtp.h.

4.82.2.15 int_t smtp_session_t::spf

Definition at line 121 of file smtp.h.

4.82.2.16 bool_t smtp_session_t::submission

Definition at line 106 of file smtp.h.

4.82.2.17 bool_t smtp_session_t::suggested_eight_bit

Definition at line 108 of file smtp.h.

4.82.2.18 `size_t smtp_session_t::suggested_length`

Definition at line 112 of file smtp.h.

4.82.2.19 `int_t smtp_session_t::virus`

Definition at line 123 of file smtp.h.

4.83 statistics_vp_t Struct Reference

```
#include <statistics.h>
```

Data Fields

- MYSQL_STMT ** [stmt](#)
- uint64_t [val](#)

4.83.1 Detailed Description

Definition at line 26 of file statistics.h.

4.83.2 Field Documentation

4.83.2.1 MYSQL_STMT** statistics_vp_t::stmt

Definition at line 27 of file statistics.h.

Referenced by [statistics_init\(\)](#), and [statistics_refresh\(\)](#).

4.83.2.2 uint64_t statistics_vp_t::val

Definition at line 28 of file statistics.h.

Referenced by [statistics_process\(\)](#), and [statistics_refresh\(\)](#).

4.84 subnet_t Struct Reference

```
#include <host.h>
```

Data Fields

- [uint32_t mask](#)
- [ip_t address](#)

4.84.1 Detailed Description

Definition at line 80 of file host.h.

4.84.2 Field Documentation

4.84.2.1 ip_t subnet_t::address

Definition at line 82 of file host.h.

Referenced by `ip_matches_subnet()`, and `ip_subnet_st()`.

4.84.2.2 uint32_t subnet_t::mask

Definition at line 81 of file host.h.

Referenced by `ip_matches_subnet()`, and `ip_subnet_st()`.

4.85 teacher_data_t Struct Reference

```

- [uint64_t](#) signum
- [uint64_t](#) keynum
- [stringer_t](#) * signature
- [stringer_t](#) * username
- [stringer_t](#) * password

4.85.1 Detailed Description

Definition at line 12 of file teacher.h.

4.85.2 Field Documentation

4.85.2.1 int_t teacher_data_t::completed

Definition at line 13 of file teacher.h.

Referenced by teacher_data_delete(), teacher_data_get(), teacher_data_save(), and teacher_process().

4.85.2.2 int_t teacher_data_t::disposition

Definition at line 13 of file teacher.h.

Referenced by teacher_data_delete(), teacher_data_fetch(), teacher_data_get(), teacher_data_save(), teacher_print_form(), and teacher_process().

4.85.2.3 uint64_t teacher_data_t::keynum

Definition at line 14 of file teacher.h.

Referenced by teacher_data_fetch(), teacher_data_get(), teacher_data_save(), teacher_print_form(), and teacher_process().

4.85.2.4 stringer_t * teacher_data_t::password

Definition at line 15 of file teacher.h.

Referenced by teacher_add_cookie(), teacher_data_delete(), teacher_data_fetch(), teacher_data_free(), teacher_data_get(), teacher_data_save(), and teacher_process().

4.85.2.5 stringer_t * teacher_data_t::signature

Definition at line 15 of file teacher.h.

Referenced by teacher_data_delete(), teacher_data_fetch(), teacher_data_free(), teacher_data_get(), teacher_data_save(), and teacher_process().

4.85.2.6 uint64_t teacher_data_t::signum

Definition at line 14 of file teacher.h.

Referenced by teacher_data_delete(), teacher_data_fetch(), teacher_data_get(), teacher_data_save(), and teacher_print_form().

4.85.2.7 stringer_t * teacher_data_t::username

Definition at line 15 of file teacher.h.

Referenced by teacher_data_delete(), teacher_data_fetch(), teacher_data_free(), teacher_data_get(), teacher_data_save(), and teacher_process().

4.85.2.8 uint64_t teacher_data_t::usernum

Definition at line 14 of file teacher.h.

Referenced by teacher_data_delete(), teacher_data_fetch(), teacher_data_get(), teacher_data_save(), and teacher_process().

- char * [position](#)
- size_t [length](#)
- size_t [remaining](#)

4.87.1 Detailed Description

Definition at line 11 of file parsers.h.

4.87.2 Field Documentation

4.87.2.1 char* tok_state_t::block

Definition at line 13 of file parsers.h.

Referenced by tok_pop_init_bl(), and tok_pop_init_st().

4.87.2.2 size_t tok_state_t::length

Definition at line 14 of file parsers.h.

Referenced by tok_pop_init_bl(), and tok_pop_init_st().

4.87.2.3 char * tok_state_t::position

Definition at line 13 of file parsers.h.

Referenced by tok_pop(), tok_pop_init_bl(), and tok_pop_init_st().

4.87.2.4 size_t tok_state_t::remaining

Definition at line 14 of file parsers.h.

Referenced by tok_pop(), tok_pop_init_bl(), and tok_pop_init_st().

4.87.2.5 char tok_state_t::token

Definition at line 12 of file parsers.h.

Referenced by tok_pop(), tok_pop_init_bl(), and tok_pop_init_st().

Chapter 5

File Documentation

5.1 src/core/buckets/arrays.c File Reference

```
#include "magma.h"
```

Functions

- `array_t * ar_alloc (size_t size)`
Allocate an array of a specified number of elements.
- `size_t ar_avail_get (array_t *array)`
Get the maximum number of elements allocated in an array.
- `size_t ar_length_get (array_t *array)`
Get the number of elements actively stored in an array.
- `uint32_t ar_field_type (array_t *array, size_t element)`
- `stringer_t * ar_field_st (array_t *array, size_t element)`
Return the value of an element in an array that holds a managed string.
- `chr_t * ar_field_ns (array_t *array, size_t element)`
Return the value of an element in an array that holds a null-terminated string.
- `array_t * ar_field_ar (array_t *array, size_t element)`
Return the value of an element in an array that holds another array.
- `placer_t * ar_field_pl (array_t *array, size_t element)`
Return the value of an element in an array that holds a placer.
- `void * ar_field_ptr (array_t *array, size_t element)`
Return the value of an element in an array that holds a pointer.
- `void ar_length_set (array_t *array, size_t used)`
Manually set the number of used elements in an array.
- `int_t ar_append (array_t **array, uint32_t type, void *item)`
- `void ar_free (array_t *array)`
Free an array object and all of its underlying elements.

- `array_t * ar_dupe (array_t *array)`

Create a duplicate copy of the array.

5.1.1 Function Documentation

5.1.1.1 `array_t* ar_alloc (size_t size)`

Allocate an array of a specified number of elements. [arrays.c](#)

Parameters:

size the number of elements the array is capable of holding.

Returns:

NULL on failure, or a pointer to the newly allocated array on success.

Definition at line 15 of file `arrays.c`.

References `ARRAY_MAX_ELEMENTS`, `log_error`, `log_pedantic`, and `mm_wipe()`.

Referenced by `ar_append()`, `ar_dupe()`, `mail_mime_part()`, `mail_mime_split()`, `mail_mime_type_parameters()`, and `meta_data_fetch_message_tags()`.

5.1.1.2 `int_t ar_append (array_t **array, uint32_t type, void *item)`

Definition at line 294 of file `arrays.c`.

References `ar_alloc()`, `ar_avail_get()`, `ar_length_get()`, `ar_length_set()`, `ARRAY_TYPE_EMPTY`, `log_pedantic`, `mm_free()`, and `mm_move()`.

Referenced by `ar_dupe()`, `imap_parse_arguments()`, `imap_parse_array()`, `imap_parse_dataitems()`, `mail_mime_part()`, `mail_mime_split()`, `mail_mime_type_parameters()`, `meta_data_fetch_message_tags()`, and `portal_smtp_create_data()`.

5.1.1.3 `size_t ar_avail_get (array_t *array)`

Get the maximum number of elements allocated in an array.

Parameters:

array a pointer to the array to be examined.

Returns:

NULL on failure, or the number of elements the array can hold.

Definition at line 52 of file `arrays.c`.

References `log_pedantic`.

Referenced by `ar_append()`, `ar_dupe()`, `ar_free()`, and `ar_length_set()`.

5.1.1.4 `array_t* ar_dupe (array_t *array)`

Create a duplicate copy of the array.

Note:

The new array might not correspond precisely to the layout of the original.
Deep copies will be made of all elements that are also arrays.. Managed strings will be copied, but neither empty strings nor pointers will be.

Parameters:

array a pointer to the array to be copied.

Returns:

NULL on failure, or a pointer to the new copy of the array on success.

Definition at line 411 of file arrays.c.

References `ar_alloc()`, `ar_append()`, `ar_avail_get()`, `ar_dupe()`, `ARRAY_TYPE_ARRAY`, `ARRAY_TYPE_EMPTY`, `ARRAY_TYPE_POINTER`, `ARRAY_TYPE_STRINGER`, `st_dupe()`, and `type()`.

Referenced by `ar_dupe()`, and `meta_message_dupe()`.

5.1.1.5 `array_t* ar_field_ar (array_t * array, size_t element)`

Return the value of an element in an array that holds another array.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to an array object with the element's data on success.

Definition at line 182 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_ARRAY`, and `log_pedantic`.

Referenced by `imap_fetch_body()`.

5.1.1.6 `chr_t* ar_field_ns (array_t * array, size_t element)`

Return the value of an element in an array that holds a null-terminated string.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string with the element's data on success.

Definition at line 153 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_NULLER`, and `log_pedantic`.

5.1.1.7 `placer_t* ar_field_pl (array_t * array, size_t element)`

Return the value of an element in an array that holds a placer.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a placer with the element's data on success.

Definition at line 211 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_PLACER`, `log_pedantic`, and `placer_t`.

5.1.1.8 void* ar_field_ptr (array_t * array, size_t element)

Return the value of an element in an array that holds a pointer.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a generic pointer to the element's data on success.

Definition at line 240 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_POINTER`, and `log_pedantic`.

Referenced by `imap_fetch_body_part()`, `imap_fetch_bodystructure()`, `mail_mime_free()`, `mail_mime_generate_boundary()`, `portal_message_attachments()`, and `portal_message_body()`.

5.1.1.9 stringer_t* ar_field_st (array_t * array, size_t element)

Return the value of an element in an array that holds a managed string.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a managed string with the element's data on success.

Definition at line 124 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_STRINGER`, and `log_pedantic`.

Referenced by `imap_fetch_bodystructure()`, `mail_mime_part()`, `meta_folders_stats_tags()`, `portal_endpoint_messages_list()`, `portal_endpoint_messages_tag()`, and `portal_message_tags_array()`.

5.1.1.10 uint32_t ar_field_type (array_t * array, size_t element)

Definition at line 93 of file arrays.c.

References `ar_length_get()`, `ARRAY_TYPE_EMPTY`, and `log_pedantic`.

Referenced by `ar_field_ar()`, `ar_field_ns()`, `ar_field_pl()`, `ar_field_ptr()`, `ar_field_st()`, and `imap_fetch_body()`.

5.1.1.11 void ar_free (array_t * array)

Free an array object and all of its underlying elements.

Note:

Array elements that are managed strings, and aren't empty or of `ARRAY_TYPE_POINTER` will be freed.

Returns:

This function returns no value.

Definition at line 368 of file arrays.c.

References `ar_avail_get()`, `ar_free()`, `ARRAY_TYPE_ARRAY`, `ARRAY_TYPE_EMPTY`, `ARRAY_TYPE_PLACER`, `ARRAY_TYPE_POINTER`, `ARRAY_TYPE_STRINGER`, `log_pedantic`, `mm_free()`, `st_free()`, and `type()`.

Referenced by `ar_free()`, `imap_command_parser()`, `imap_fetch_bodystructure()`, `imap_parse_arguments()`, `imap_parse_array()`, `imap_session_destroy()`, `mail_mime_free()`, `mail_mime_part()`, `mail_mime_type_parameters()`, `meta_message_free()`, `portal_endpoint_messages_tag()`, and `portal_smtp_create_data()`.

5.1.1.12 `size_t ar_length_get (array_t * array)`

Get the number of elements actively stored in an array.

Parameters:

array a pointer to the array to be counted.

Returns:

NULL on failure, or the number of elements currently held in the array.

Definition at line 71 of file arrays.c.

References `log_pedantic`.

Referenced by `ar_append()`, `ar_field_ar()`, `ar_field_ns()`, `ar_field_pl()`, `ar_field_ptr()`, `ar_field_st()`, `ar_field_type()`, `imap_append()`, `imap_close()`, `imap_copy()`, `imap_create()`, `imap_delete()`, `imap_examine()`, `imap_expunge()`, `imap_fetch()`, `imap_fetch_body()`, `imap_fetch_body_header()`, `imap_fetch_body_tag()`, `imap_fetch_bodystructure()`, `imap_flag_parse()`, `imap_get_ar_ar()`, `imap_get_ptr()`, `imap_get_st_ar()`, `imap_get_type_ar()`, `imap_id()`, `imap_list()`, `imap_login()`, `imap_lsub()`, `imap_parse_dataitems()`, `imap_rename()`, `imap_search()`, `imap_search_messages_inner()`, `imap_select()`, `imap_status()`, `imap_store()`, `imap_subscribe()`, `mail_mime_free()`, `mail_mime_generate_boundary()`, `mail_mime_part()`, `mail_mime_type_parameters()`, `meta_folders_stats_tags()`, `portal_endpoint_messages_list()`, `portal_endpoint_messages_tag()`, `portal_message_attachments()`, `portal_message_tags_array()`, and `portal_smtp_create_data()`.

5.1.1.13 `void ar_length_set (array_t * array, size_t used)`

Manually set the number of used elements in an array.

Parameters:

array a pointer to the array to be adjusted.

used the new number of elements (less than the array's maximum size) to be set as the array's used length.

Returns:

This function returns no value.

Definition at line 269 of file arrays.c.

References `ar_avail_get()`, and `log_pedantic`.

Referenced by `ar_append()`.

Enumerations

- `enum M_POOL_STATUS { PL_ERROR = -1, PL_AVAILABLE = 0, PL_RESERVED = 1 }`

Functions

- `struct __attribute__((packed))`
- `void pool_free (pool_t *pool)`
Free an object pool.
- `uint32_t pool_get_count (pool_t *pool)`
Return the total number of items allocated inside a pool.
- `uint32_t pool_get_timeout (pool_t *pool)`
Get the timeout value for a pool.
- `uint64_t pool_get_failures (pool_t *pool)`
Get the number of failed requests for a pool.
- `uint32_t pool_get_available (pool_t *pool)`
Return the total number of items actively available in a pool.
- `pool_t * pool_alloc (uint32_t count, uint32_t timeout)`
Allocate a new object pool.
- `status_t pool_get_status (pool_t *pool, uint32_t item)`
Get the status flag for an item in a pool.
- `status_t pool_set_status (pool_t *pool, uint32_t item, status_t status)`
Set the status flag for an item in a pool.
- `void pool_release (pool_t *pool, uint32_t item)`

Return an object to a pool and set its status to PL_AVAILABLE.

- void * [pool_get_obj](#) (pool_t *pool, uint32_t item)

Return a specified object from a pool.

- status_t [pool_pull](#) (pool_t *pool, uint32_t *item)

Return the first available object in a pool.

- void * [pool_swap_obj](#) (pool_t *pool, uint32_t item, void *object)

Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

- void * [pool_set_obj](#) (pool_t *pool, uint32_t item, void *object)

Set the object pointer for a given item in a pool.

- array_t * [ar_alloc](#) (size_t size)

arrays.c

- int_t [ar_append](#) (array_t **array, uint32_t type, void *item)

- size_t [ar_avail_get](#) (array_t *array)

Get the maximum number of elements allocated in an array.

- array_t * [ar_dupe](#) (array_t *array)

Create a duplicate copy of the array.

- array_t * [ar_field_ar](#) (array_t *array, size_t element)

Return the value of an element in an array that holds another array.

- chr_t * [ar_field_ns](#) (array_t *array, size_t element)

Return the value of an element in an array that holds a null-terminated string.

- placer_t * [ar_field_pl](#) (array_t *array, size_t element)

Return the value of an element in an array that holds a placer.

5.2.4 Function Documentation

5.2.4.1 struct __attribute__((packed)) [read]

< The type of the rr set covered by this record.

- < The numerical id of the cryptographic algorithm used to generate the signature.
- < The number of labels in the original RRSIG RR owner name.
- < The original TTL of the covered rrset as it appears in the authoritative zone.
- < The expiration date after which the RRSIG record must not be used for authentication.
- < The inception date before which the RRSIG record must not be used for authentication.
- < A tag (selector) identifying the corresponding DNSKEY RR (which isn't necessarily unique) that validates this record.
- < A label identifying the owner name of the DNSKEY RR validating this signature (must not use name compression).

Definition at line 58 of file buckets.h.

References count, lock, objects, and status.

5.2.4.2 `array_t* ar_alloc (size_t size)`

[arrays.c](#) [arrays.c](#)

Parameters:

size the number of elements the array is capable of holding.

Returns:

NULL on failure, or a pointer to the newly allocated array on success.

Definition at line 15 of file arrays.c.

References ARRAY_MAX_ELEMENTS, log_error, log_pedantic, and mm_wipe().

Referenced by ar_append(), ar_dupe(), mail_mime_part(), mail_mime_split(), mail_mime_type_parameters(), and meta_data_fetch_message_tags().

5.2.4.3 `int_t ar_append (array_t ** array, uint32_t type, void * item)`

Definition at line 294 of file arrays.c.

References ar_alloc(), ar_avail_get(), ar_length_get(), ar_length_set(), ARRAY_TYPE_EMPTY, log_pedantic, mm_free(), and mm_move().

Referenced by ar_dupe(), imap_parse_arguments(), imap_parse_array(), imap_parse_dataitems(), mail_mime_part(), mail_mime_split(), mail_mime_type_parameters(), meta_data_fetch_message_tags(), and portal_smtp_create_data().

5.2.4.4 `size_t ar_avail_get (array_t * array)`

Get the maximum number of elements allocated in an array.

Parameters:

array a pointer to the array to be examined.

Returns:

NULL on failure, or the number of elements the array can hold.

Definition at line 52 of file arrays.c.

References log_pedantic.

Referenced by ar_append(), ar_dupe(), ar_free(), and ar_length_set().

5.2.4.5 `array_t* ar_dupe (array_t * array)`

Create a duplicate copy of the array.

Note:

The new array might not correspond precisely to the layout of the original.

Deep copies will be made of all elements that are also arrays.. Managed strings will be copied, but neither empty strings nor pointers will be.

Parameters:

array a pointer to the array to be copied.

Returns:

NULL on failure, or a pointer to the new copy of the array on success.

Definition at line 411 of file arrays.c.

References `ar_alloc()`, `ar_append()`, `ar_avail_get()`, `ar_dupe()`, `ARRAY_TYPE_ARRAY`, `ARRAY_TYPE_EMPTY`, `ARRAY_TYPE_POINTER`, `ARRAY_TYPE_STRINGER`, `st_dupe()`, and `type()`.

Referenced by `ar_dupe()`, and `meta_message_dupe()`.

5.2.4.6 `array_t* ar_field_ar (array_t * array, size_t element)`

Return the value of an element in an array that holds another array.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to an array object with the element's data on success.

Definition at line 182 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_ARRAY`, and `log_pedantic`.

Referenced by `imap_fetch_body()`.

5.2.4.7 `chr_t* ar_field_ns (array_t * array, size_t element)`

Return the value of an element in an array that holds a null-terminated string.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string with the element's data on success.

Definition at line 153 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_NULLER`, and `log_pedantic`.

5.2.4.8 `placer_t* ar_field_pl (array_t * array, size_t element)`

Return the value of an element in an array that holds a placer.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a placer with the element's data on success.

Definition at line 211 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_PLACER`, `log_pedantic`, and `placer_t`.

5.2.4.9 `void* ar_field_ptr (array_t * array, size_t element)`

Return the value of an element in an array that holds a pointer.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a generic pointer to the element's data on success.

Definition at line 240 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_POINTER`, and `log_pedantic`.

Referenced by `imap_fetch_body_part()`, `imap_fetch_bodystructure()`, `mail_mime_free()`, `mail_mime_generate_boundary()`, `portal_message_attachments()`, and `portal_message_body()`.

5.2.4.10 `stringer_t* ar_field_st (array_t * array, size_t element)`

Return the value of an element in an array that holds a managed string.

Parameters:

array a pointer to the array to be examined. *element* the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a managed string with the element's data on success.

Definition at line 124 of file arrays.c.

References `ar_field_type()`, `ar_length_get()`, `ARRAY_TYPE_STRINGER`, and `log_pedantic`.

Referenced by `imap_fetch_bodystructure()`, `mail_mime_part()`, `meta_folders_stats_tags()`, `portal_endpoint_messages_list()`, `portal_endpoint_messages_tag()`, and `portal_message_tags_array()`.

5.2.4.11 `uint32_t ar_field_type (array_t * array, size_t element)`

Definition at line 93 of file arrays.c.

References `ar_length_get()`, `ARRAY_TYPE_EMPTY`, and `log_pedantic`.

Referenced by `ar_field_ar()`, `ar_field_ns()`, `ar_field_pl()`, `ar_field_ptr()`, `ar_field_st()`, and `imap_fetch_body()`.

5.2.4.12 void ar_free (array_t * array)

Free an array object and all of its underlying elements.

Note:

Array elements that are managed strings, and aren't empty or of ARRAY_TYPE_POINTER will be freed.

Returns:

This function returns no value.

Definition at line 368 of file arrays.c.

References ar_avail_get(), ar_free(), ARRAY_TYPE_ARRAY, ARRAY_TYPE_EMPTY, ARRAY_TYPE_PLACER, ARRAY_TYPE_POINTER, ARRAY_TYPE_STRINGER, log_pedantic, mm_free(), st_free(), and type().

Referenced by ar_free(), imap_command_parser(), imap_fetch_bodystructure(), imap_parse_arguments(), imap_parse_array(), imap_session_destroy(), mail_mime_free(), mail_mime_part(), mail_mime_type_parameters(), meta_message_free(), portal_endpoint_messages_tag(), and portal_smtp_create_data().

5.2.4.13 size_t ar_length_get (array_t * array)

Get the number of elements actively stored in an array.

Parameters:

array a pointer to the array to be counted.

Returns:

NULL on failure, or the number of elements currently held in the array.

Definition at line 71 of file arrays.c.

References log_pedantic.

Referenced by ar_append(), ar_field_ar(), ar_field_ns(), ar_field_pl(), ar_field_ptr(), ar_field_st(), ar_field_type(), imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_fetch_body(), imap_fetch_body_header(), imap_fetch_body_tag(), imap_fetch_bodystructure(), imap_flag_parse(), imap_get_ar_ar(), imap_get_ptr(), imap_get_st_ar(), imap_get_type_ar(), imap_id(), imap_list(), imap_login(), imap_lsub(), imap_parse_dataitems(), imap_rename(), imap_search(), imap_search_messages_inner(), imap_select(), imap_status(), imap_store(), imap_subscribe(), mail_mime_free(), mail_mime_generate_boundary(), mail_mime_part(), mail_mime_type_parameters(), meta_folders_stats_tags(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_message_attachments(), portal_message_tags_array(), and portal_smtp_create_data().

5.2.4.14 void ar_length_set (array_t * array, size_t used)

Manually set the number of used elements in an array.

Parameters:

array a pointer to the array to be adjusted.

used the new number of elements (less than the array's maximum size) to be set as the array's used length.

Returns:

This function returns no value.

Definition at line 269 of file arrays.c.

References ar_avail_get(), and log_pedantic.

Referenced by ar_append().

5.2.4.15 `pool_t* pool_alloc (uint32_t count, uint32_t timeout)`

Allocate a new object pool.

Parameters:

count the number of items the pool can hold.

timeout a timeout for pool requests in seconds (specify 0 for infinite wait).

Returns:

NULL on failure,

Definition at line 33 of file pool.c.

References `log_info`, `MAGMA_CORE_POOL_OBJECTS_LIMIT`, `MAGMA_CORE_POOL_TIMEOUT_LIMIT`, `mm_alloc()`, `mm_free()`, `mutex_init()`, and `pool_t`.

Referenced by `cache_start()`, `spf_start()`, and `sql_start()`.

5.2.4.16 `void pool_free (pool_t * pool)`

Free an object pool.

Warning:

This function will not free the underlying objects contained by the pool!

Parameters:

pool the pool to be released from memory.

Returns:

This function returns no value.

Definition at line 16 of file pool.c.

References `mm_free()`, and `mutex_destroy()`.

Referenced by `cache_stop()`, `spf_stop()`, and `sql_stop()`.

5.2.4.17 `uint32_t pool_get_available (pool_t * pool)`

Return the total number of items actively available in a pool.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the total number of items actively available in the specified pool.

Definition at line 94 of file pool.c.

5.2.4.18 uint32_t pool_get_count (pool_t * pool)

Return the total number of items allocated inside a pool.

Note:

Some of the item slots may be unused, but remain reserved.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the allocation count of the pool on success.

Definition at line 83 of file pool.c.

Referenced by pool_get_obj(), and pool_set_obj().

5.2.4.19 uint64_t pool_get_failures (pool_t * pool)

Get the number of failed requests for a pool.

Note:

Most of the time, a failure will correspond to a timeout, but can also be triggered by other error conditions.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the number of failed requests made on the specified pool.

Definition at line 119 of file pool.c.

References mutex_lock(), and mutex_unlock().

5.2.4.20 void* pool_get_obj (pool_t * pool, uint32_t item)

Return a specified object from a pool.

Parameters:

pool the pool containing the object.

item the identifier of the object to query.

Returns:

NULL on failure, or the object corresponding to the specified item number.

Definition at line 241 of file pool.c.

References log_pedantic, mutex_lock(), mutex_unlock(), and pool_get_count().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), cache_stop(), dspam_check(), dspam_train(), mail_db_update_message_folder(), pool_swap_obj(), spf_check(), spf_stop(), sql_insert_conn(), sql_num_rows_conn(), sql_ping(), sql_query_conn(), sql_query_res_conn(), sql_stop(), sql_write_conn(), stmt_rebuild(), stmt_start(), tran_commit(), tran_rollback(), and tran_start().

5.2.4.21 status_t pool_get_status (pool_t * pool, uint32_t item)

Get the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use;; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.

item the identifier of the item to be queried.

Returns:

PL_ERROR on failure; otherwise, the status of the specified item.

Definition at line 139 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, and PL_RESERVED.

Referenced by pool_pull(), and pool_swap_obj().

5.2.4.22 uint32_t pool_get_timeout (pool_t * pool)

Get the timeout value for a pool.

Note:

A timeout of zero will cause threads to wait forever.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the timeout value of the specified pool, in seconds.

Definition at line 107 of file pool.c.

5.2.4.23 status_t pool_pull (pool_t * pool, uint32_t * item)

Return the first available object in a pool.

Note:

If no object can be returned immediately, wait for the pool's configured timeout value, in seconds, for an object to become available. If the timeout is zero, wait indefinitely.

Parameters:

item A pointer to a number that will store the zero-based indexed of the first available item in the pool.

Returns:

PL_RESERVED on success or PL_ERROR if an object couldn't be reserved.

Definition at line 178 of file pool.c.

References mutex_lock(), mutex_unlock(), PL_AVAILABLE, PL_ERROR, PL_RESERVED, pool_get_status(), and pool_set_status().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_insert(), sql_num_rows(), sql_query(), sql_query_res(), sql_write(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), and tran_start().

5.2.4.24 void pool_release (pool_t * pool, uint32_t item)

Return an object to a pool and set its status to PL_AVAILABLE.

Parameters:

pool the pool tracking the returned item.

item the identifier of the item being returned.

Returns:

This function returns no value.

Definition at line 226 of file pool.c.

References mutex_lock(), mutex_unlock(), PL_AVAILABLE, and pool_set_status().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_insert(), sql_num_rows(), sql_query(), sql_query_res(), sql_write(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), tran_commit(), tran_rollback(), and tran_start().

5.2.4.25 void* pool_set_obj (pool_t * pool, uint32_t item, void * object)

Set the object pointer for a given item in a pool.

Parameters:

pool the pool containing the specified item.

item the item id to be adjusted.

object the new value of the object corresponding to the specified item.

Returns:

NULL on failure, or a pointer to the object that was set.

Definition at line 267 of file pool.c.

References log_pedantic, mutex_lock(), mutex_unlock(), and pool_get_count().

Referenced by cache_start(), pool_swap_obj(), spf_start(), and sql_start().

5.2.4.26 status_t pool_set_status (pool_t * pool, uint32_t item, status_t status)

Set the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use,; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.

item the identifier of the item to be adjusted.

status the new status for the item.

Returns:

PL_ERROR on failure; otherwise, the new status value of the specified item.

Definition at line 159 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, and PL_RESERVED.

Referenced by pool_pull(), and pool_release().

5.2.4.27 void* pool_swap_obj (pool_t * pool, uint32_t item, void * object)

Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

Parameters:

pool a pointer to the pool to be modified.

item the zero-based index of the object in the pool to be updated.

object the new value of the object corresponding to the specified item.

Returns:

a pointer to the original pool object's value, or NULL on failure.

LOW: Currently the function loops until the requested object is available. A superior implementation would hook into the release function and detect when the desired object is available and perform the swap at that point.

Definition at line 293 of file pool.c.

References mutex_lock(), mutex_unlock(), PL_AVAILABLE, pool_get_obj(), pool_get_status(), and pool_set_obj().

5.2.4.28 stacker_t* stacker_alloc (void * free_function)

Allocate a new instance of a stacked list.

Parameters:

free_function if not NULL, a pointer to a function that will be used to free the data underlying each node in the stacked list.

Returns:

NULL on failure, or a pointer to the newly created stack list on success.

Definition at line 46 of file stacked.c.

References log_pedantic, mm_alloc(), mm_free(), mutex_init(), and stacker_t.

5.2.4.29 void stacker_free (stacker_t * stack)

Free a stacked list and all of its underlying data nodes.

Parameters:

stack a pointer to the stacked list to be freed.

Returns:

This function returns no value.

Definition at line 15 of file stacked.c.

References mm_free(), mutex_destroy(), and stacker_node_t.

5.2.4.30 unsigned long stacker_nodes (stacker_t * *stack*)

Get the number of nodes in a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

the number of nodes currently held by the specified stacked list.

Definition at line 75 of file stacked.c.

References mutex_lock(), and mutex_unlock().

5.2.4.31 void* stacker_pop (stacker_t * *stack*)

Pop the last entry off a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

NULL on failure or the value of the last node in the stacked list.

Definition at line 141 of file stacked.c.

References mm_free(), mutex_lock(), mutex_unlock(), and stacker_node_t.

5.2.4.32 int_t stacker_push (stacker_t * *stack*, void * *data*)

[stacked.c](#) [stacked.c](#)

Parameters:

stack a pointer to the stacked list to be updated.

data a pointer to the data to associated with the new stacked list node.

Returns:

0 on failure or 1 on success.

Definition at line 96 of file stacked.c.

References log_error, log_pedantic, mm_alloc(), mutex_lock(), mutex_unlock(), and stacker_node_t.

5.2.5 Variable Documentation

5.2.5.1 pool_t

Definition at line 66 of file buckets.h.

Referenced by pool_alloc().

```
#include "magma.h"
```

Functions

- void `pool_free` (`pool_t` *pool)
Free an object pool.
- `pool_t` * `pool_alloc` (`uint32_t` count, `uint32_t` timeout)
Allocate a new object pool.
- `uint32_t` `pool_get_count` (`pool_t` *pool)
Return the total number of items allocated inside a pool.
- `uint32_t` `pool_get_available` (`pool_t` *pool)
Return the total number of items actively available in a pool.
- `uint32_t` `pool_get_timeout` (`pool_t` *pool)
Get the timeout value for a pool.
- `uint64_t` `pool_get_failures` (`pool_t` *pool)
Get the number of failed requests for a pool.
- `status_t` `pool_get_status` (`pool_t` *pool, `uint32_t` item)
Get the status flag for an item in a pool.
- `status_t` `pool_set_status` (`pool_t` *pool, `uint32_t` item, `status_t` status)
Set the status flag for an item in a pool.
- `status_t` `pool_pull` (`pool_t` *pool, `uint32_t` *item)
Return the first available object in a pool.
- void `pool_release` (`pool_t` *pool, `uint32_t` item)
Return an object to a pool and set its status to PL_AVAILABLE.
- void * `pool_get_obj` (`pool_t` *pool, `uint32_t` item)
Return a specified object from a pool.
- void * `pool_set_obj` (`pool_t` *pool, `uint32_t` item, void *object)
Set the object pointer for a given item in a pool.
- void * `pool_swap_obj` (`pool_t` *pool, `uint32_t` item, void *object)
Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

5.3.1 Function Documentation

5.3.1.1 `pool_t`* `pool_alloc` (`uint32_t` count, `uint32_t` timeout)

Allocate a new object pool.

Parameters:

count the number of items the pool can hold.

timeout a timeout for pool requests in seconds (specify 0 for infinite wait).

Returns:

NULL on failure,

Definition at line 33 of file pool.c.

References log_info, MAGMA_CORE_POOL_OBJECTS_LIMIT, MAGMA_CORE_POOL_TIMEOUT_LIMIT, mm_alloc(), mm_free(), mutex_init(), and pool_t.

Referenced by cache_start(), spf_start(), and sql_start().

5.3.1.2 void pool_free (pool_t * pool)

Free an object pool.

Warning:

This function will not free the underlying objects contained by the pool!

Parameters:

pool the pool to be released from memory.

Returns:

This function returns no value.

Definition at line 16 of file pool.c.

References mm_free(), and mutex_destroy().

Referenced by cache_stop(), spf_stop(), and sql_stop().

5.3.1.3 uint32_t pool_get_available (pool_t * pool)

Return the total number of items actively available in a pool.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the total number of items actively available in the specified pool.

Definition at line 94 of file pool.c.

5.3.1.4 uint32_t pool_get_count (pool_t * pool)

Return the total number of items allocated inside a pool.

Note:

Some of the item slots may be unused, but remain reserved.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the allocation count of the pool on success.

Definition at line 83 of file pool.c.

Referenced by pool_get_obj(), and pool_set_obj().

5.3.1.5 uint64_t pool_get_failures (pool_t * pool)

Get the number of failed requests for a pool.

Note:

Most of the time, a failure will correspond to a timeout, but can also be triggered by other error conditions.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the number of failed requests made on the specified pool.

Definition at line 119 of file pool.c.

References mutex_lock(), and mutex_unlock().

5.3.1.6 void* pool_get_obj (pool_t * pool, uint32_t item)

Return a specified object from a pool.

Parameters:

pool the pool containing the object.

item the identifier of the object to query.

Returns:

NULL on failure, or the object corresponding to the specified item number.

Definition at line 241 of file pool.c.

References log_pedantic, mutex_lock(), mutex_unlock(), and pool_get_count().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), cache_stop(), dspam_check(), dspam_train(), mail_db_update_message_folder(), pool_swap_obj(), spf_check(), spf_stop(), sql_insert_conn(), sql_num_rows_conn(), sql_ping(), sql_query_conn(), sql_query_res_conn(), sql_stop(), sql_write_conn(), stmt_rebuild(), stmt_start(), tran_commit(), tran_rollback(), and tran_start().

5.3.1.7 status_t pool_get_status (pool_t * pool, uint32_t item)

Get the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use;; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.

item the identifier of the item to be queried.

Returns:

PL_ERROR on failure; otherwise, the status of the specified item.

Definition at line 139 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, and PL_RESERVED.

Referenced by pool_pull(), and pool_swap_obj().

5.3.1.8 uint32_t pool_get_timeout (pool_t * pool)

Get the timeout value for a pool.

Note:

A timeout of zero will cause threads to wait forever.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the timeout value of the specified pool, in seconds.

Definition at line 107 of file pool.c.

5.3.1.9 status_t pool_pull (pool_t * pool, uint32_t * item)

Return the first available object in a pool.

Note:

If no object can be returned immediately, wait for the pool's configured timeout value, in seconds, for an object to become available. If the timeout is zero, wait indefinitely.

Parameters:

item A pointer to a number that will store the zero-based indexed of the first available item in the pool.

Returns:

PL_RESERVED on success or PL_ERROR if an object couldn't be reserved.

Definition at line 178 of file pool.c.

References mutex_lock(), mutex_unlock(), PL_AVAILABLE, PL_ERROR, PL_RESERVED, pool_get_status(), and pool_set_status().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_insert(), sql_num_rows(), sql_query(), sql_query_res(), sql_write(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), and tran_start().

5.3.1.10 void pool_release (pool_t * pool, uint32_t item)

Return an object to a pool and set its status to PL_AVAILABLE.

Parameters:

pool the pool tracking the returned item.

item the identifier of the item being returned.

Returns:

This function returns no value.

Definition at line 226 of file pool.c.

References mutex_lock(), mutex_unlock(), PL_AVAILABLE, and pool_set_status().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_insert(), sql_num_rows(), sql_query(), sql_query_res(), sql_write(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), tran_commit(), tran_rollback(), and tran_start().

5.3.1.11 void* pool_set_obj (pool_t * pool, uint32_t item, void * object)

Set the object pointer for a given item in a pool.

Parameters:

pool the pool containing the specified item.

item the item id to be adjusted.

object the new value of the object corresponding to the specified item.

Returns:

NULL on failure, or a pointer to the object that was set.

Definition at line 267 of file pool.c.

References log_pedantic, mutex_lock(), mutex_unlock(), and pool_get_count().

Referenced by cache_start(), pool_swap_obj(), spf_start(), and sql_start().

5.3.1.12 status_t pool_set_status (pool_t * pool, uint32_t item, status_t status)

Set the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use,; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.

item the identifier of the item to be adjusted.

status the new status for the item.

Returns:

PL_ERROR on failure; otherwise, the new status value of the specified item.

Definition at line 159 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, and PL_RESERVED.

Referenced by pool_pull(), and pool_release().

5.3.1.13 void* pool_swap_obj (pool_t * *pool*, uint32_t *item*, void * *object*)

Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

Parameters:

pool a pointer to the pool to be modified.

item the zero-based index of the object in the pool to be updated.

object the new value of the object corresponding to the specified item.

Returns:

a pointer to the original pool object's value, or NULL on failure.

LOW: Currently the function loops until the requested object is available. A superior implementation would hook into the release function and detect when the desired object is available and perform the swap at that point.

Definition at line 293 of file pool.c.

References mutex_lock(), mutex_unlock(), PL_AVAILABLE, pool_get_obj(), pool_get_status(), and pool_set_obj().

```
#include "magma.h"
```

Functions

- void `stacker_free` (`stacker_t` *stack)
Free a stacked list and all of its underlying data nodes.
- `stacker_t` * `stacker_alloc` (void *free_function)
Allocate a new instance of a stacked list.
- uint64_t `stacker_nodes` (`stacker_t` *stack)
Get the number of nodes in a stacked list.
- int_t `stacker_push` (`stacker_t` *stack, void *data)
Push a new entry onto the end of a stacked list.
- void * `stacker_pop` (`stacker_t` *stack)
Pop the last entry off a stacked list.

5.4.1 Function Documentation

5.4.1.1 `stacker_t`* `stacker_alloc` (void * *free_function*)

Allocate a new instance of a stacked list.

Parameters:

free_function if not NULL, a pointer to a function that will be used to free the data underlying each node in the stacked list.

Returns:

NULL on failure, or a pointer to the newly created stack list on success.

Definition at line 46 of file stacked.c.

References `log_pedantic`, `mm_alloc()`, `mm_free()`, `mutex_init()`, and `stacker_t`.

5.4.1.2 void `stacker_free` (`stacker_t` * *stack*)

Free a stacked list and all of its underlying data nodes.

Parameters:

stack a pointer to the stacked list to be freed.

Returns:

This function returns no value.

Definition at line 15 of file stacked.c.

References `mm_free()`, `mutex_destroy()`, and `stacker_node_t`.

5.4.1.3 `uint64_t stacker_nodes (stacker_t * stack)`

Get the number of nodes in a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

the number of nodes currently held by the specified stacked list.

Definition at line 75 of file `stacked.c`.

References `mutex_lock()`, and `mutex_unlock()`.

5.4.1.4 `void* stacker_pop (stacker_t * stack)`

Pop the last entry off a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

NULL on failure or the value of the last node in the stacked list.

Definition at line 141 of file `stacked.c`.

References `mm_free()`, `mutex_lock()`, `mutex_unlock()`, and `stacker_node_t`.

5.4.1.5 `int_t stacker_push (stacker_t * stack, void * data)`

Push a new entry onto the end of a stacked list. [stacked.c](#)

Parameters:

stack a pointer to the stacked list to be updated.

data a pointer to the data to associated with the new stacked list node.

Returns:

0 on failure or 1 on success.

Definition at line 96 of file `stacked.c`.

References `log_error`, `log_pedantic`, `mm_alloc()`, `mutex_lock()`, `mutex_unlock()`, and `stacker_node_t`.

5.5 src/core/checksum/adler.c File Reference

```

```

Functions

- `uint32_t hash_adler32 (void *buffer, size_t length)`

Return an Adler-32 hash of the specified data.

5.5.1 Function Documentation

5.5.1.1 `uint32_t hash_adler32 (void *buffer, size_t length)`

Return an Adler-32 hash of the specified data.

Parameters:

buffer a pointer to the data to be hashed.

length the length, in bytes, of the data to be hashed.

Returns:

a 32 bit number containing the Adler-32 hash of the data.

Definition at line 16 of file `adler.c`.

Referenced by `compress_bzip()`, `compress_import()`, `compress_lzo()`, `compress_zlib()`, `decompress_bzip()`, `decompress_lzo()`, `decompress_zlib()`, `deprecated_scramble_decrypt()`, `deprecated_scramble_encrypt()`, `deprecated_scramble_import()`, `scramble_decrypt()`, `scramble_encrypt()`, and `scramble_import()`.

Computer a 32-bit Fletcher hash for a block of data.

5.6.1 Function Documentation

5.6.1.1 uint32_t [crc24_checksum](#) (void * *buffer*, size_t *length*)

Generate a 24-bit CRC value for the Privacy Enhanced Message format.

Note:

This function uses the predefined initial value and polynomial defined in RFC 4880.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the updated 24-bit CRC value in a 32-bit unsigned integer.

Definition at line 59 of file crc.c.

References `crc24_final()`, `crc24_init()`, and `CRC24_POLY`.

Definition at line 30 of file crc.c.

References `CRC24_POLY`.

5.6.1.5 `uint32_t crc32_checksum (void * buffer, size_t length)`

Get 32-bit CRC value for a specified block of data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the 32-bit CRC value of the specified data.

Definition at line 115 of file crc.c.

References `crc32_update()`.

5.6.1.6 `uint32_t crc32_update (void * buffer, size_t length, uint32_t crc)`

Update a 32-bit CRC value with a check of additional data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

crc the previously computed CRC value, or 0 if this is the initial pass.

Returns:

the updated 32-bit CRC value of the specified data.

Definition at line 83 of file crc.c.

References A, B, C, crc32_table, D, and S8.

Referenced by crc32_checksum().

5.6.1.7 uint64_t crc64_checksum (void * *buffer*, size_t *length*)

Get 64-bit CRC value for a specified block of data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the 64-bit CRC value of the specified data.

Definition at line 156 of file crc.c.

References crc64_update().

Referenced by smtp_bounce(), and smtp_reply().

5.6.1.8 uint64_t crc64_update (void * *buffer*, size_t *length*, uint64_t *crc*)

Update a 64-bit CRC value with a check of additional data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

crc the previously computed CRC value, or 0 if this is the initial pass.

Returns:

the updated 64-bit CRC value of the specified data.

Definition at line 126 of file crc.c.

References A, A1, B, C, crc64_table, D, S32, and S8.

Referenced by crc64_checksum().

5.6.1.9 uint32_t hash_adler32 (void * *buffer*, size_t *length*)

Return an Adler-32 hash of the specified data.

Parameters:

buffer a pointer to the data to be hashed.

length the length, in bytes, of the data to be hashed.

Returns:

a 32 bit number containing the Adler-32 hash of the data.

Definition at line 16 of file adler.c.

Referenced by compress_bzip(), compress_import(), compress_lzo(), compress_zlib(), decompress_bzip(), decompress_lzo(), decompress_zlib(), deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), deprecated_scramble_import(), scramble_decrypt(), scramble_encrypt(), and scramble_import().

5.6.1.10 uint32_t hash_fletcher32 (void * *buffer*, size_t *length*)

Computer a 32-bit Fletcher hash for a block of data.

Parameters:

- buffer* a pointer to the data buffer to be checked.
- length* the length, in bytes, of the data to be checked.

Returns:

- a 32-bit number containing the Fletcher hash of the specified data.

Definition at line 16 of file fletcher.c.

Referenced by hashed_bucket().

5.6.1.11 uint32_t hash_murmur32 (void * *buffer*, size_t *length*)

Generate a 32-bit Murmur hash of a block of data.

Parameters:

- buffer* a pointer to the block of data to be hashed.
- length* the length, in bytes, of the block of data to be hashed.

Returns:

- the 32-bit value of the Murmur hash of the specified block of data.

Definition at line 17 of file murmur.c.

References data.

5.6.1.12 uint64_t hash_murmur64 (void * *buffer*, size_t *length*)

Generate a 64-bit Murmur hash of a block of data.

Parameters:

- buffer* a pointer to the block of data to be hashed.
- length* the length, in bytes, of the block of data to be hashed.

Returns:

- the 64-bit value of the Murmur hash of the specified block of data.

Definition at line 72 of file murmur.c.

References data.

5.7.2 Function Documentation

5.7.2.1 uint32_t crc24_checksum (void * buffer, size_t length)

Generate a 24-bit CRC value for the Privacy Enhanced Message format.

Note:

This function uses the predefined initial value and polynomial defined in RFC 4880.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the updated 24-bit CRC value in a 32-bit unsigned integer.

Definition at line 59 of file `crc.c`.

References `crc24_final()`, `crc24_init()`, and `CRC24_POLY`.

Referenced by `prime_pem_unwrap()`, and `prime_pem_wrap()`.

5.7.2.4 `uint32_t crc24_update (void * buffer, size_t length, uint32_t crc)`

Definition at line 30 of file `crc.c`.

References `CRC24_POLY`.

5.7.2.5 `uint32_t crc32_checksum (void * buffer, size_t length)`

Get 32-bit CRC value for a specified block of data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the 32-bit CRC value of the specified data.

Definition at line 115 of file `crc.c`.

References `crc32_update()`.

5.7.2.6 uint32_t crc32_update (void * *buffer*, size_t *length*, uint32_t *crc*)

Update a 32-bit CRC value with a check of additional data.

Parameters:

- buffer* a pointer to the data to be checked.
- length* the length, in bytes, of the input buffer.
- crc* the previously computed CRC value, or 0 if this is the initial pass.

Returns:

the updated 32-bit CRC value of the specified data.

Definition at line 83 of file crc.c.

References A, B, C, crc32_table, D, and S8.

Referenced by crc32_checksum().

5.7.2.7 uint64_t crc64_checksum (void * *buffer*, size_t *length*)

Get 64-bit CRC value for a specified block of data.

Parameters:

- buffer* a pointer to the data to be checked.
- length* the length, in bytes, of the input buffer.

Returns:

the 64-bit CRC value of the specified data.

Definition at line 156 of file crc.c.

References crc64_update().

Referenced by smtp_bounce(), and smtp_reply().

5.7.2.8 uint64_t crc64_update (void * *buffer*, size_t *length*, uint64_t *crc*)

Update a 64-bit CRC value with a check of additional data.

Parameters:

- buffer* a pointer to the data to be checked.
- length* the length, in bytes, of the input buffer.
- crc* the previously computed CRC value, or 0 if this is the initial pass.

Returns:

the updated 64-bit CRC value of the specified data.

Definition at line 126 of file crc.c.

Functions

- `uint32_t hash_murmur32` (`void *buffer`, `size_t length`)
Generate a 32-bit Murmur hash of a block of data.
- `uint64_t hash_murmur64` (`void *buffer`, `size_t length`)
Generate a 64-bit Murmur hash of a block of data.

5.9.1 Function Documentation

5.9.1.1 `uint32_t hash_murmur32` (`void * buffer`, `size_t length`)

Generate a 32-bit Murmur hash of a block of data.

Parameters:

- buffer* a pointer to the block of data to be hashed.
length the length, in bytes, of the block of data to be hashed.

Returns:

the 32-bit value of the Murmur hash of the specified block of data.

Definition at line 17 of file `murmur.c`.

References `data`.

5.9.1.2 `uint64_t hash_murmur64` (`void * buffer`, `size_t length`)

Generate a 64-bit Murmur hash of a block of data.

Parameters:

- buffer* a pointer to the block of data to be hashed.
length the length, in bytes, of the block of data to be hashed.

Returns:

the 64-bit value of the Murmur hash of the specified block of data.

Definition at line 72 of file `murmur.c`.

References `data`.

Determine whether a specified character is a numeric character.
- `bool_t chr_punctuation (uchar_t c)`
Determine whether a specified character is a punctuation character.
- `bool_t chr_blank (uchar_t c)`
Determine whether a specified character is a blank character (space or tab).
- `bool_t chr_whitespace (uchar_t c)`
Determine whether a specified character is a whitespace character (blank or).
- `bool_t chr_is_class (uchar_t c, uchar_t *chrs, size_t chrln)`
Determine whether a character belongs to a custom set of values.

5.10.1 Function Documentation

5.10.1.1 `bool_t chr_alphanumeric (uchar_t c)`

Determine whether a specified character is alpha-numeric. [ascii.c](#)

Parameters:

`c` the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 43 of file `ascii.c`.

5.10.1.2 `bool_t chr_ascii (uchar_t c)`

Determine whether a specified character is an ASCII character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 15 of file `ascii.c`.

5.10.1.3 `bool_t chr_blank (uchar_t c)`

Determine whether a specified character is a blank character (space or tab).

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 113 of file `ascii.c`.

5.10.1.4 `bool_t chr_is_class (uchar_t c, uchar_t * chrs, size_t chrlen)`

Determine whether a character belongs to a custom set of values.

Parameters:

c the character to be verified.

chrs a pointer to a buffer containing the family of valid character values.

chrlen the number of characters in the testing set.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 143 of file `ascii.c`.

5.10.1.5 `bool_t chr_lower (uchar_t c)`

Determine whether a specified character is a lowercase character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 57 of file `ascii.c`.

5.10.1.6 `bool_t chr_numeric (uchar_t c)`

Determine whether a specified character is a numeric character.

Parameters:

`c` the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 85 of file `ascii.c`.

Referenced by `process_find_pid()`, and `process_kill()`.

5.10.1.7 `bool_t chr_printable (uchar_t c)`

Determine whether a specified character is a printable character.

Parameters:

`c` the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 29 of file `ascii.c`.

Referenced by `contact_validate_detail()`, `contact_validate_name()`, and `hex_encode_st_debug()`.

5.10.1.8 `bool_t chr_punctuation (uchar_t c)`

Determine whether a specified character is a punctuation character.

Parameters:

`c` the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 99 of file `ascii.c`.

5.10.1.9 `bool_t chr_upper (uchar_t c)`

Determine whether a specified character is an uppercase character.

Parameters:

`c` the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 71 of file `ascii.c`.

5.10.1.10 bool_t chr_whitespace (uchar_t *c*)

Determine whether a specified character is a whitespace character (blank or).

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 127 of file ascii.c.

Referenced by auth_sanitise_address(), and imap_command_log_safe().

5.12.1 Function Documentation

5.12.1.1 [int_t mm_cmp_ci_eq](#) (void *a, void *b, [size_t](#) len)

[equal.c](#) [equal.c](#)

Parameters:

- a* a pointer to the first buffer in memory to be compared.
- b* a pointer to the second buffer in memory to be compared.
- len* the length, in bytes, of the comparison that is to take place.

Returns:

- 1 if $a < b$, 1 if $b < a$, or 0 if the two memory blocks are equal.

Definition at line 52 of file equal.c.

References `lower_chr()`, and `mm_empty()`.

Referenced by `imap_fetch_body_header()`, `mail_add_forward_headers()`, `mail_add_outbound_headers()`, `mail_discover_encoding()`, `mail_discover_type()`, `mail_header_fetch_all()`, `mail_headers()`, `mail_message()`, `mail_message_cleanup()`, `mail_mime_encoding()`, and `mail_mime_type()`.

5.12.1.2 `int_t mm_cmp_cs_eq (void *a, void *b, size_t len)`

Perform a case-sensitive comparison of two memory blocks.

Parameters:

- a* a pointer to the first buffer in memory to be compared.
- b* a pointer to the second buffer in memory to be compared.
- len* the length, in bytes, of the comparison that is to take place.

Returns:

- 1 if $a < b$, 1 if $b < a$, or 0 if the two memory blocks are equal.

Definition at line 17 of file equal.c.

References `mm_empty()`.

5.12.1.6 int_t st_cmp_cs_ends (stringer_t * s, stringer_t * ends)

Perform a case-sensitive check to see if one string ends in another, comparing backwards.

Note:

The value of the result depends on a backwards character comparison pattern, not a forward one.

Parameters:

- s* the managed string to have its ending characters examined.
- ends* the managed string to be compared against the end of *s*.

Returns:

-1 if $s < ends$, 1 if $ends < s$ or 0 if *s* ends with the content of *ends*.

Definition at line 17 of file ends.c.

References st_empty_out().

Referenced by folder_count(), http_content_load_directory(), http_content_load_fonts(), http_content_start(), http_load_file(), smtp_client_send_data(), and stats_sum_errors().

5.12.1.7 int_t st_cmp_cs_eq (stringer_t * a, stringer_t * b)

Perform a case-sensitive comparison of two managed strings.

Parameters:

- a* the first managed string to be compared.
- b* the second managed string to be compared.

Returns:

- 1 if $a < b$, 1 if $b < a$, or 0 if the two memory blocks are equal.

Definition at line 85 of file equal.c.

References st_empty_out().

Referenced by args_parse(), auth_data_fetch(), auth_login(), auth_response(), auth_sanitise_username(), cmp_mt_mt(), config_free(), config_output_value(), config_output_value_generic(), config_value_set(), contact_business(), contact_business_add_error(), contact_print_form(), contact_print_message(), contact_process(), encrypted_chunk_get(), folder_count(), get_header_opt(), http_content_load_directory(), http_load_file(), http_response(), ident_mt_mt(), imap_fetch(), imap_fetch_bodystructure(), magma_folder_find_full_name(), magma_folder_find_name(), mail_add_inbound_headers(), mail_add_outbound_headers(), mail_get_chunk(), meta_folders_by_name(), meta_get(), portal_endpoint_contacts_add(), prime_pem_unwrap(), process_find_pid(), register_business_step2(), sanity_check(), servers_output_settings(), sess_get(), slots_key(), smtp_accept_message(), smtp_bounce(), smtp_get_action(), smtp_parse_mail_from_path(), smtp_update_receive_stats(), spool_check_file(), STACK_OF(), stats_get_name_pos(), stats_sum_errors(), teacher_process(), tls_cipher(), tls_version(), and user_config_edit().

5.12.1.8 int_t st_cmp_cs_starts (stringer_t * s, stringer_t * starts)

Perform a case-sensitive check to see if one string starts with another.

Parameters:

- s* the managed string to have its beginning characters examined.
- starts* the managed string to be compared against the beginning of *s*.

Returns:

- 1 if $s < starts$, 1 if $starts < s$ or 0 if *s* begins with *starts*.

5.12.1.9 bool_t st_search_chr (stringer_t * haystack, chr_t needle, size_t * location)

Search for a character inside of a managed string, and save its location.

Parameters:

- haystack* the managed string to be searched.

needle the character to be found in the string.

location if not NULL, a pointer to store the index of needle if found, or 0 on no match.

Returns:

true if the specified character was found or false otherwise.

Definition at line 117 of file search.c.

References log_pedantic, and st_empty_out().

Referenced by auth_data_fetch(), and register_data_insert_user().

5.12.1.10 bool_t st_search_ci (stringer_t * haystack, stringer_t * needle, size_t * location)

search.c search.c

Parameters:

haystack the managed string to be searched.

needle the managed string to be found.

location if not NULL, a pointer to store the index of needle if found, or 0 on no match.

Returns:

true if the string is found or false otherwise.

Definition at line 68 of file search.c.

5.12.1.11 bool_t st_search_cs (stringer_t * haystack, stringer_t * needle, size_t * location)

Search one managed string for an occurrence of another in a case-sensitive manner, and save its location.

Parameters:

haystack the managed string to be searched.

needle the managed string to be found.

location if not NULL, a pointer to store the index of needle if found, or 0 on no match.

Returns:

true if the string is found or false otherwise.

Perform a case-insensitive comparison of two managed strings.

5.14.1 Function Documentation

5.14.1.1 int_t mm_cmp_ci_eq (void *a, void *b, size_t len)

Perform a case-insensitive comparison of two memory blocks. [equal.c](#)

Parameters:

- a** a pointer to the first buffer in memory to be compared.
- b** a pointer to the second buffer in memory to be compared.
- len** the length, in bytes, of the comparison that is to take place.

Returns:

- 1 if a < b, 1 if b < a, or 0 if the two memory blocks are equal.

Definition at line 52 of file equal.c.

5.18.3 Enumeration Type Documentation

5.18.3.1 anonymous enum

Enumerator:

EMPTY

Definition at line 164 of file core.h.

5.18.3.2 enum M_TYPE

Different types used throughout.

Enumerator:

M_TYPE_EMPTY M_TYPE_EMPTY.
M_TYPE_MULTI M_TYPE_MULTI is [multi_t](#).
M_TYPE_ENUM M_TYPE_ENUM is enum.
M_TYPE_BOOLEAN M_TYPE_BOOLEAN is bool_t.
M_TYPE_BLOCK M_TYPE_BLOCK is void pointer.
M_TYPE_NULLER M_TYPE_NULLER is char pointer.
M_TYPE_PLACER M_TYPE_PLACER is placer_t struct.
M_TYPE_STRINGER M_TYPE_STRINGER is stringer_t pointer.
M_TYPE_INT8 M_TYPE_INT8 is int8_t.
M_TYPE_INT16 M_TYPE_INT16 is int16_t.
M_TYPE_INT32 M_TYPE_INT32 is int32_t.
M_TYPE_INT64 M_TYPE_INT64 is int64_t.
M_TYPE_UINT8 M_TYPE_UINT8 is uint8_t.
M_TYPE_UINT16 M_TYPE_UINT16 is uint16_t.
M_TYPE_UINT32 M_TYPE_UINT32 is uint32_t.
M_TYPE_UINT64 M_TYPE_UINT64 is uint64_t.
M_TYPE_FLOAT M_TYPE_FLOAT is float.
M_TYPE_DOUBLE M_TYPE_DOUBLE is double.

Definition at line 143 of file core.h.

5.18.4 Function Documentation

5.18.4.1 struct __attribute__((packed)) [read]

Definition at line 94 of file core.h.

5.18.4.2 char* type (M_TYPE type)

Takes a type code and returns the fully enumerated string associated with that type.

Parameters:

type The type code to evaluate.

Returns:

Null terminated string containing type name. String is stored in static buffer and returned as a pointer.

Definition at line 17 of file type.c.

Functions

- `size_t base64_encoded_length_mod (size_t length)`
TODO: Switch to always using the "_wrap" length function, which can then become base64_(en|de)coded_length().
- `size_t base64_encoded_length (size_t length)`
- `size_t base64_encoded_length_wrap (size_t length, size_t wrap, base64_wrap_t type)`
Calculate the length of a binary buffer after being encoded with using base64.
- `size_t base64_decoded_length_mod (size_t length)`
- `size_t base64_decoded_length (size_t length)`
- `stringer_t * base64_encode (stringer_t *s, stringer_t *output)`
Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.
- `stringer_t * base64_encode_wrap (stringer_t *s, size_t wrap, base64_wrap_t type, stringer_t *output)`
Encode a binary buffer using base64, with a configurable line length, and terminating character.
- `stringer_t * base64_encode_mod (stringer_t *s, stringer_t *output)`
Perform modified base64 encoding on a managed string without padding or line splitting.
- `stringer_t * base64_encode_opts (stringer_t *s, uint32_t opts, bool_t modified)`
Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.
- `stringer_t * base64_decode (stringer_t *s, stringer_t *output)`
Perform base64 decoding on a managed string.
- `stringer_t * base64_decode_mod (stringer_t *s, stringer_t *output)`
Perform modified base64 decoding on a managed string. without padding or line splitting.
- `stringer_t * base64_decode_opts (stringer_t *s, uint32_t opts, bool_t modified)`
Perform base64 decoding on a managed string.

5.19.1 Function Documentation

5.19.1.1 stringer_t* base64_decode (stringer_t * s, stringer_t * output)

Perform base64 decoding on a managed string. [base64.c](#)

Parameters:

- `s` the managed string to be base64 decoded.
- output*** a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the decoded result on success.

Definition at line 536 of file base64.c.

References mappings_t::base64, base64_decoded_length(), log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), st_valid_tracked(), and mappings_t::values.

Referenced by base64_decode_opts(), mail_insert_chunk_base64(), prime_pem_unwrap(), smtp_auth_login(), and smtp_auth_plain().

5.19.1.2 stringer_t* base64_decode_mod (stringer_t * s, stringer_t * output)

Perform modified base64 decoding on a managed string. without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified decoded result on success.

Definition at line 636 of file base64.c.

References base64_decoded_length_mod(), mappings_t::base64_mod, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), st_valid_tracked(), and mappings_t::values.

Referenced by auth_data_fetch(), base64_decode_opts(), meta_data_fetch_keys(), meta_data_fetch_shard(), meta_data_fetch_user(), and smtp_fetch_inbound().

5.19.1.3 stringer_t* base64_decode_opts (stringer_t * s, uint32_t opts, bool_t modified)

Perform base64 decoding on a managed string.

Parameters:

s the managed string to be base64 decoded.

opts the options value of the managed string which will be allocated and receive the decoded output.

modified if true, use modified base64 encoding; if false, use normal base64 decoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the decoded result on success.

Definition at line 734 of file base64.c.

References base64_decode(), base64_decode_mod(), base64_decoded_length(), base64_decoded_length_mod(), log_pedantic, st_alloc_opts(), st_empty_out(), and st_free().

5.19.1.4 size_t base64_decoded_length (size_t length)

Definition at line 130 of file base64.c.

Referenced by base64_decode(), and base64_decode_opts().

5.19.1.5 `size_t base64_decoded_length_mod (size_t length)`

Definition at line 111 of file base64.c.

Referenced by `base64_decode_mod()`, and `base64_decode_opts()`.

5.19.1.6 `stringer_t* base64_encode (stringer_t * s, stringer_t * output)`

Perform base64 encoding on a managed string with padding and line splitting at `BASE64_LINE_WRAP_LENGTH` characters.

Parameters:

s the managed string to be base64 encoded.

output a managed string to receive the encoded output; if passed as `NULL`, one will be allocated to the caller.

Returns:

`NULL` on failure, or a pointer to the managed string containing the encoded result on success.

Definition at line 156 of file base64.c.

Referenced by `base64_encode_opts()`, `mail_insert_chunk_base64()`, and `mail_mime_encode_part()`.

5.19.1.7 `stringer_t* base64_encode_mod (stringer_t * s, stringer_t * output)`

Perform modified base64 encoding on a managed string without padding or line splitting.

Note:

In this function, the `'+'` and `'/'` characters are replaced with `'-'` and `'_'` respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 modified-encoded.

output a managed string to receive the encoded output; if passed as `NULL`, an output buffer will be allocated which must be freed by the caller.

Returns:

`NULL` on failure, or a newly allocated managed string containing the modified encoded result on success.

Definition at line 412 of file base64.c.

References `base64_encoded_length_mod()`, `mappings_t::base64_mod`, `mappings_t::characters`, `log_pedantic`, `mappings`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `auth_login()`, `base64_encode_opts()`, `meta_data_insert_keys()`, `meta_data_insert_shard()`, `register_data_insert_user()`, and `smtp_fetch_authorization()`.

5.19.1.8 `stringer_t* base64_encode_opts (stringer_t * s, uint32_t opts, bool_t modified)`

Perform base64 encoding on a managed string with padding and line splitting at `BASE64_LINE_WRAP_LENGTH` characters.

Parameters:

s the managed string to be base64 encoded.

opts the options value of the managed string which will be allocated and receive the encoded output.

modified if true, use modified base64 encoding; if false, use normal base64 encoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded result on success.

Definition at line 496 of file base64.c.

References base64_encode(), base64_encode_mod(), base64_encoded_length(), base64_encoded_length_mod(), log_pedantic, st_alloc_opts(), st_empty_out(), and st_free().

5.19.1.9 stringer_t* base64_encode_wrap (stringer_t * s, size_t wrap, base64_wrap_t type, stringer_t * output)

Encode a binary buffer using base64, with a configurable line length, and terminating character.

Parameters:

s the managed string to be base64 encoded.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller. *

Returns:

Definition at line 271 of file base64.c.

References mappings_t::base64, base64_encoded_length_wrap(), BASE64_LINE_WRAP_CRLF, BASE64_LINE_WRAP_LF, mappings_t::characters, log_error, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

5.19.1.10 size_t base64_encoded_length (size_t length)

Definition at line 34 of file base64.c.

References BASE64_LINE_WRAP_LENGTH.

Referenced by base64_encode(), and base64_encode_opts().

5.19.1.11 size_t base64_encoded_length_mod (size_t length)

TODO: Switch to always using the "_wrap" length function, which can then become base64_(en|de)coded_length().

Definition at line 12 of file base64.c.

Referenced by base64_encode_mod(), and base64_encode_opts().

5.19.1.12 size_t base64_encoded_length_wrap (size_t length, size_t wrap, base64_wrap_t type)

Calculate the length of a binary buffer after being encoded with using base64.

Note:

If line wrapping is enabled, the output will assume a trailing end of line sequence.

Parameters:

- length* the length of the binary buffer.
- wrap* the maximum length of each line, or 0 to disable line wrapping.
- type* the line delimiter sequence being used.

Returns:

- the length of the encoded output.

Definition at line 71 of file base64.c.

References BASE64_LINE_WRAP_NONE, and log_pedantic.

Referenced by base64_encode_wrap(), and prime_pem_wrap().

- [bool_t hex_valid_chr](#) ([uchr_t](#) c)
hex.c
- [byte_t hex_decode_chr](#) ([uchr_t](#) a, [uchr_t](#) b)

Decode a hex character pair as a single byte (usually for URL decoding).

- `size_t hex_count_st (stringer_t *s)`
Count the number of hex characters in a string.
- `size_t hex_valid_st (stringer_t *s)`
Determine whether a managed string is a properly formatted hex string and return the number found.
- `stringer_t * hex_decode_st (stringer_t *h, stringer_t *output)`
Convert a hex string into a binary data blob.
- `stringer_t * hex_encode_st (stringer_t *b, stringer_t *output)`
Convert a block of binary data into a hex string.
- `uchr_t * hex_encode_chr (byte_t b, uchr_t *output)`
- `stringer_t * hex_encode_st_debug (stringer_t *input, size_t maxlen)`
Encode data in a human readable way, for debugging purposes.
- `stringer_t * hex_encode_opts (stringer_t *input, uint32_t opts)`
Allocates an output string of appropriate size with specified opts for hex encoding of input.
- `stringer_t * hex_decode_opts (stringer_t *input, uint32_t opts)`
Allocates an output string of appropriate size with specified opts for hex decoding of input.
- `stringer_t * qp_decode (stringer_t *s)`
qp.c
- `stringer_t * qp_encode (stringer_t *s)`
Perform QP (quoted-printable) encoding of a string.
- `bool_t url_valid_chr (uchr_t c)`
url.c
- `size_t url_valid_st (stringer_t *s)`
Check a URL string for validity.
- `stringer_t * url_decode (stringer_t *s)`
Decode a URL-encoded string into its original representation.
- `stringer_t * url_encode (stringer_t *s)`
Encode a data buffer as a valid URL component.
- `stringer_t * zbase32_decode (stringer_t *s)`
zbase32.c
- `stringer_t * zbase32_encode (stringer_t *s)`
Encode data as a zbase32 string.

5.20.1 Define Documentation

5.20.1.1 `#define BASE64_LINE_WRAP_LENGTH 76`

Definition at line 24 of file encodings.h.

Referenced by `base64_encode()`, and `base64_encoded_length()`.

5.20.1.2 `#define QP_LINE_WRAP_LENGTH 76`

Definition at line 23 of file encodings.h.

Referenced by `qp_encode()`.

5.20.1.3 `#define URL_MAX_LENGTH 1048576`

Note:

When considering a change to the URL length limit, the following statistics may be useful:

Internet Explorer: 2,048 characters for the host/path and 2,083 characters overall
Firefox: limited to 65,536 visible characters, but longer URL will still work
Safari: at least 80,000 characters
Opera: at least 190,000 characters
IIS: by default the limit is 16,384 but can be increased
Apache: by default 4,000 characters

Definition at line 22 of file encodings.h.

5.20.2 Enumeration Type Documentation

5.20.2.1 `enum base64_wrap_t`

Enumerator:

BASE64_LINE_WRAP_NONE

BASE64_LINE_WRAP_LF

BASE64_LINE_WRAP_CRLF

Definition at line 26 of file encodings.h.

5.20.3 Function Documentation

5.20.3.1 `stringer_t* base64_decode (stringer_t * s, stringer_t * output)`

[base64.c](#) [base64.c](#)

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the decoded result on success.

Definition at line 536 of file base64.c.

References `mappings_t::base64`, `base64_decoded_length()`, `log_pedantic`, `mappings`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, `st_valid_tracked()`, and `mappings_t::values`.

Referenced by `base64_decode_opts()`, `mail_insert_chunk_base64()`, `prime_pem_unwrap()`, `smtp_auth_login()`, and `smtp_auth_plain()`.

5.20.3.2 `stringer_t* base64_decode_mod (stringer_t * s, stringer_t * output)`

Perform modified base64 decoding on a managed string. without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified decoded result on success.

Definition at line 636 of file base64.c.

References `base64_decoded_length_mod()`, `mappings_t::base64_mod`, `log_pedantic`, `mappings`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, `st_valid_tracked()`, and `mappings_t::values`.

5.20.3.3 `stringer_t* base64_decode_opts (stringer_t * s, uint32_t opts, bool_t modified)`

Perform base64 decoding on a managed string.

Parameters:

s the managed string to be base64 decoded.

opts the options value of the managed string which will be allocated and receive the decoded output.

modified if true, use modified base64 encoding; if false, use normal base64 decoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the decoded result on success.

Definition at line 734 of file base64.c.

References `base64_decode()`, `base64_decode_mod()`, `base64_decoded_length()`, `base64_decoded_length_mod()`, `log_pedantic`, `st_alloc_opts()`, `st_empty_out()`, and `st_free()`.

5.20.3.4 `size_t base64_decoded_length (size_t length)`

Definition at line 130 of file base64.c.

Referenced by `base64_decode()`, and `base64_decode_opts()`.

5.20.3.5 `size_t base64_decoded_length_mod (size_t length)`

Definition at line 111 of file base64.c.

Referenced by `base64_decode_mod()`, and `base64_decode_opts()`.

5.20.3.6 stringer_t* base64_encode (stringer_t * s, stringer_t * output)

Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

Parameters:

s the managed string to be base64 encoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a pointer to the managed string containing the encoded result on success.

Definition at line 156 of file base64.c.

References mappings_t::base64, base64_encoded_length(), BASE64_LINE_WRAP_LENGTH, mappings_t::characters, log_error, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

5.20.3.7 stringer_t* base64_encode_mod (stringer_t * s, stringer_t * output)

Perform modified base64 encoding on a managed string without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 modified-encoded.

output a managed string to receive the encoded output; if passed as NULL, an output buffer will be allocated which must be freed by the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified encoded result on success.

Definition at line 412 of file base64.c.

References base64_encoded_length_mod(), mappings_t::base64_mod, mappings_t::characters, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_login(), base64_encode_opts(), meta_data_insert_keys(), meta_data_insert_shard(), register_data_insert_user(), and smtp_fetch_authorization().

5.20.3.8 stringer_t* base64_encode_opts (stringer_t * s, uint32_t opts, bool_t modified)

Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

Parameters:

s the managed string to be base64 encoded.

opts the options value of the managed string which will be allocated and receive the encoded output.

modified if true, use modified base64 encoding; if false, use normal base64 encoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded result on success.

Definition at line 496 of file base64.c.

References `base64_encode()`, `base64_encode_mod()`, `base64_encoded_length()`, `base64_encoded_length_mod()`, `log_pedantic`, `st_alloc_opts()`, `st_empty_out()`, and `st_free()`.

5.20.3.9 `stringer_t* base64_encode_wrap (stringer_t * s, size_t wrap, base64_wrap_t type, stringer_t * output)`

Encode a binary buffer using base64, with a configurable line length, and terminating character.

Parameters:

s the managed string to be base64 encoded.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller. *

Returns:

Definition at line 271 of file base64.c.

References `mappings_t::base64`, `base64_encoded_length_wrap()`, `BASE64_LINE_WRAP_CRLF`, `BASE64_LINE_WRAP_LF`, `mappings_t::characters`, `log_error`, `log_pedantic`, `mappings`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `prime_pem_wrap()`.

5.20.3.10 `size_t base64_encoded_length (size_t length)`

Definition at line 34 of file base64.c.

References `BASE64_LINE_WRAP_LENGTH`.

Referenced by `base64_encode()`, and `base64_encode_opts()`.

5.20.3.11 `size_t base64_encoded_length_mod (size_t length)`

TODO: Switch to always using the "_wrap" length function, which can then become `base64_(en|de)coded_length()`.

Definition at line 12 of file base64.c.

Referenced by `base64_encode_mod()`, and `base64_encode_opts()`.

5.20.3.12 `size_t base64_encoded_length_wrap (size_t length, size_t wrap, base64_wrap_t type)`

Calculate the length of a binary buffer after being encoded with using base64.

Note:

If line wrapping is enabled, the output will assume a trailing end of line sequence.

Parameters:

length the length of the binary buffer.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

Returns:

the length of the encoded output.

Definition at line 71 of file base64.c.

References BASE64_LINE_WRAP_NONE, and log_pedantic.

Referenced by base64_encode_wrap(), and prime_pem_wrap().

5.20.3.13 size_t hex_count_st (stringer_t * s)

Count the number of hex characters in a string.

Parameters:

s the managed string to be scanned.

Returns:

the number of valid hexadecimal characters found in the string.

Definition at line 58 of file hex.c.

References hex_valid_chr(), and st_empty_out().

Referenced by hex_decode_st().

5.20.3.14 byte_t hex_decode_chr (uchr_t a, uchr_t b)

Decode a hex character pair as a single byte (usually for URL decoding).

Parameters:

a the higher order 4-bit hexadecimal character of the byte to be encoded.

b the lower order 4-bit hexadecimal character of the byte to be decoded.

Returns:

a byte containing the value of the decoded hexadecimal character pair, or 0 on failure.

Definition at line 252 of file hex.c.

References hex_valid_chr(), log_pedantic, and lower_chr().

Referenced by hex_decode_st(), http_data_value_decode(), qp_decode(), and url_decode().

5.20.3.15 stringer_t* hex_decode_opts (stringer_t * input, uint32_t opts)

Allocates an output string of appropriate size with specified opts for hex decoding of input.

Parameters:

input Input stringer to be decoded.

Returns:

NULL on failure, otherwise allocated stringer with decoded data.

Definition at line 383 of file hex.c.

References hex_decode_st(), log_error, log_pedantic, st_alloc_opts(), st_empty, st_free(), and st_length_get().

5.20.3.16 stringer_t* hex_decode_st (stringer_t * *h*, stringer_t * *output*)

Convert a hex string into a binary data blob.

Note:

All hex strings should be composed of pairs of two hex characters representing individual bytes. Invalid hex characters will simply be ignored during processing.

Parameters:

h a managed string containing the input hex string to be decoded.

output if not NULL, a pointer to a managed string to contain the decoded binary output; if NULL, a new string will be allocated and returned to the caller.

Returns:

a pointer to a managed string containing the decoded output, or NULL on failure.

Definition at line 287 of file hex.c.

References hex_count_st(), hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_data_fetch(), and hex_decode_opts().

5.20.3.17 uchr_t* hex_encode_chr (byte_t *b*, uchr_t * *output*)

Converts a binary octet into a pair of lowercase hex characters. The result is returned inside a thread specific static character buffer. If a valid pointer is also supplied using the output variable then the result will also be written to the memory the pointer indicates.

Parameters:

b The binary octet being encoded.

output A pointer to the memory where the result should be stored or NULL if the result should only be returned.

Returns:

Returns the two character hex representation of the binary input using a thread localized character buffer.

Definition at line 84 of file hex.c.

References mm_wipe(), and number.

Referenced by hex_encode_st(), and hex_encode_st_debug().

5.20.3.18 stringer_t* hex_encode_opts (stringer_t * *input*, uint32_t *opts*)

Allocates an output string of appropriate size with specified opts for hex encoding of input.

Parameters:

input Input stringer to be encoded.

Returns:

NULL on failure, otherwise allocated stringer with encoded data.

Definition at line 346 of file hex.c.

References hex_encode_st(), log_error, log_pedantic, st_alloc_opts(), st_empty, st_free(), and st_length_get().

5.20.3.19 stringer_t* hex_encode_st (stringer_t * *b*, stringer_t * *output*)

Convert a block of binary data into a hex string.

Parameters:

b a managed string containing the raw data to be encoded.

output if not NULL, a pointer to a managed string that will store the encoded output; if NULL, a new managed string will be allocated and returned to the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the hex-encoded output on success.

Definition at line 124 of file hex.c.

References `hex_encode_chr()`, `log_pedantic`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `auth_login()`, and `hex_encode_opts()`.

5.20.3.20 stringer_t* hex_encode_st_debug (stringer_t * *input*, size_t *maxlen*)

Encode data in a human readable way, for debugging purposes.

Note:

All printable ASCII data will be displayed as-is; all other characters will be shown as formatted hex pairs.

Parameters:

input a pointer to a managed string containing the data to be formatted.

maxlen the maximum number of bytes to be displayed. If more characters are available, an ellipsis will be shown in the middle of the string to represent the abridged data, with only the leading and trailing characters returned as part of the display string.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded debug data on success.

Definition at line 178 of file hex.c.

References `chr_printable()`, `hex_encode_chr()`, `log_error`, `st_alloc()`, `st_char_get()`, `st_length_get()`, and `st_length_set()`.

5.20.3.21 bool_t hex_valid_chr (uchar_t *c*)

[hex.c](#) [hex.c](#)

Parameters:

c the character to be tested.

Returns:

true if the character is a valid hexadecimal character; false otherwise.

Definition at line 15 of file hex.c.

Referenced by `hex_count_st()`, `hex_decode_chr()`, `hex_decode_st()`, `hex_valid_st()`, `qp_decode()`, `url_decode()`, and `url_valid_st()`.

5.20.3.22 `size_t hex_valid_st (stringer_t * s)`

Determine whether a managed string is a properly formatted hex string and return the number found.

Note:

A valid hex string consists of only hexadecimal characters and whitespace, and the number of hex characters is divisible by two.

Parameters:

s the managed string to be tested.

Returns:

0 on failure, or the number of hexadecimal characters found in the managed string.

Definition at line 28 of file hex.c.

References `hex_valid_chr()`, and `st_empty_out()`.

5.20.3.23 `stringer_t* qp_decode (stringer_t * s)`

[qp.c](#) `qp.c`

Parameters:

s the managed string containing data to be decoded.

Returns:

a pointer to a managed string containing the 8-bit decoded output, or NULL on failure.

Definition at line 99 of file qp.c.

References `hex_decode_chr()`, `hex_valid_chr()`, `log_pedantic`, `st_alloc()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, and `st_length_set()`.

5.20.3.24 `stringer_t* qp_encode (stringer_t * s)`

Perform QP (quoted-printable) encoding of a string.

Parameters:

s a pointer to a managed string containing data to be encoded.

Returns:

a pointer to a managed string containing the QP encoded data, or NULL on failure.

Definition at line 17 of file qp.c.

References `HEAP`, `JOINTED`, `log_pedantic`, `MANAGED_T`, `PLACER`, `QP_LINE_WRAP_LENGTH`, `st_alloc_opts()`, `st_append`, `st_data_get()`, and `st_empty_out()`.

Referenced by `mail_build_signature()`, and `mail_mime_encode_part()`.

5.20.3.25 `stringer_t* url_decode (stringer_t * s)`

Decode a URL-encoded string into its original representation.

Parameters:

s a managed string containing the UR componentL to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the original data represented by the URL-encoded input on success.

Definition at line 127 of file url.c.

References `hex_decode_chr()`, `hex_valid_chr()`, `log_pedantic`, `st_alloc()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, and `st_length_set()`.

5.20.3.26 stringer_t* url_encode (stringer_t * s)

Encode a data buffer as a valid URL component.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the fully-escaped string suitable for use in a URL.

Definition at line 65 of file url.c.

References `HEAP`, `JOINTED`, `log_pedantic`, `MANAGED_T`, `PLACER`, `st_alloc_opts()`, `st_append`, `st_data_get()`, `st_empty_out()`, `st_length_set()`, and `url_valid_chr()`.

5.20.3.27 bool_t url_valid_chr (uchr_t c)

[url.c url.c](#)

Parameters:

c the character to be examined.

Returns:

true if the character is valid in a URL or false if it must be escaped.

Definition at line 15 of file url.c.

Referenced by `url_encode()`, and `url_valid_st()`.

5.20.3.28 size_t url_valid_st (stringer_t * s)

Check a URL string for validity.

Note:

This function confirms that the URL consists of only legal characters and that all escaped sequences are also valid.

Parameters:

s a managed string containing the URL to be verified.

Returns:

0 on failure, or the number of valid characters in the URL if the string is valid.

Definition at line 28 of file url.c.

References `hex_valid_chr()`, `st_empty_out()`, and `url_valid_chr()`.

5.20.3.29 `stringer_t* zbase32_decode (stringer_t * s)`

[zbase32.c](#) [zbase32.c](#)

Parameters:

`s` a managed string containing the data to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-decoded data on success.

Definition at line 64 of file `zbase32.c`.

References `log_pedantic`, `mappings`, `st_alloc()`, `st_data_get()`, `st_empty_out()`, `st_free()`, `st_length_set()`, `mappings_t::values`, and `mappings_t::zbase32`.

Referenced by `sess_get()`.

5.20.3.30 `stringer_t* zbase32_encode (stringer_t * s)`

Encode data as a zbase32 string.

Parameters:

`s` a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-encoded data on success.

Definition at line 16 of file `zbase32.c`.

References `mappings_t::characters`, `log_pedantic`, `mappings`, `st_alloc()`, `st_data_get()`, `st_empty_out()`, `st_length_set()`, and `mappings_t::zbase32`.

Referenced by `sess_token()`.

Functions

- `bool_t hex_valid_chr (uchar_t c)`
Determine whether a character is a valid hexadecimal (base 16) character.
- `size_t hex_valid_st (stringer_t *s)`
Determine whether a managed string is a properly formatted hex string and return the number found.
- `size_t hex_count_st (stringer_t *s)`
Count the number of hex characters in a string.
- `uchar_t * hex_encode_chr (byte_t b, uchar_t *output)`
- `stringer_t * hex_encode_st (stringer_t *b, stringer_t *output)`
Convert a block of binary data into a hex string.
- `stringer_t * hex_encode_st_debug (stringer_t *input, size_t maxlen)`
Encode data in a human readable way, for debugging purposes.
- `byte_t hex_decode_chr (uchar_t a, uchar_t b)`
Decode a hex character pair as a single byte (usually for URL decoding).
- `stringer_t * hex_decode_st (stringer_t *h, stringer_t *output)`
Convert a hex string into a binary data blob.
- `stringer_t * hex_encode_opts (stringer_t *input, uint32_t opts)`
Allocates an output string of appropriate size with specified opts for hex encoding of input.
- `stringer_t * hex_decode_opts (stringer_t *input, uint32_t opts)`
Allocates an output string of appropriate size with specified opts for hex decoding of input.

5.21.1 Function Documentation

5.21.1.1 `size_t hex_count_st (stringer_t * s)`

Count the number of hex characters in a string.

Parameters:

`s` the managed string to be scanned.

Returns:

the number of valid hexadecimal characters found in the string.

Definition at line 58 of file hex.c.

References `hex_valid_chr()`, and `st_empty_out()`.

Referenced by `hex_decode_st()`.

5.21.1.2 `byte_t hex_decode_chr (uchr_t a, uchr_t b)`

Decode a hex character pair as a single byte (usually for URL decoding).

Parameters:

- a* the higher order 4-bit hexadecimal character of the byte to be encoded.
- b* the lower order 4-bit hexadecimal character of the byte to be decoded.

Returns:

- a byte containing the value of the decoded hexadecimal character pair, or 0 on failure.

Definition at line 252 of file hex.c.

References `hex_valid_chr()`, `log_pedantic`, and `lower_chr()`.

Referenced by `hex_decode_st()`, `http_data_value_decode()`, `qp_decode()`, and `url_decode()`.

5.21.1.3 `stringer_t* hex_decode_opts (stringer_t * input, uint32_t opts)`

Allocates an output string of appropriate size with specified opts for hex decoding of input.

Parameters:

- input* Input stringer to be decoded.

Returns:

- NULL on failure, otherwise allocated stringer with decoded data.

Definition at line 383 of file hex.c.

References `hex_decode_st()`, `log_error`, `log_pedantic`, `st_alloc_opts()`, `st_empty`, `st_free()`, and `st_length_get()`.

5.21.1.4 `stringer_t* hex_decode_st (stringer_t * h, stringer_t * output)`

Convert a hex string into a binary data blob.

Note:

All hex strings should be composed of pairs of two hex characters representing individual bytes. Invalid hex characters will simply be ignored during processing.

Parameters:

- h* a managed string containing the input hex string to be decoded.
- output* if not NULL, a pointer to a managed string to contain the decoded binary output; if NULL, a new string will be allocated and returned to the caller.

Returns:

- a pointer to a managed string containing the decoded output, or NULL on failure.

Definition at line 287 of file hex.c.

References `hex_count_st()`, `hex_decode_chr()`, `hex_valid_chr()`, `log_pedantic`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `auth_data_fetch()`, and `hex_decode_opts()`.

5.21.1.5 `uchar_t* hex_encode_chr (byte_t b, uchar_t * output)`

Converts a binary octet into a pair of lowercase hex characters. The result is returned inside a thread specific static character buffer. If a valid pointer is also supplied using the output variable then the result will also be written to the memory the pointer indicates.

Parameters:

b The binary octet being encoded.

output A pointer to the memory where the result should be stored or NULL if the result should only be returned.

Returns:

Returns the two character hex representation of the binary input using a thread localized character buffer.

Definition at line 84 of file hex.c.

References `mm_wipe()`, and `number`.

Referenced by `hex_encode_st()`, and `hex_encode_st_debug()`.

5.21.1.6 `stringer_t* hex_encode_opts (stringer_t * input, uint32_t opts)`

Allocates an output string of appropriate size with specified opts for hex encoding of input.

Parameters:

input Input stringer to be encoded.

Returns:

NULL on failure, otherwise allocated stringer with encoded data.

Definition at line 346 of file hex.c.

References `hex_encode_st()`, `log_error`, `log_pedantic`, `st_alloc_opts()`, `st_empty`, `st_free()`, and `st_length_get()`.

5.21.1.7 `stringer_t* hex_encode_st (stringer_t * b, stringer_t * output)`

Convert a block of binary data into a hex string.

Parameters:

b a managed string containing the raw data to be encoded.

output if not NULL, a pointer to a managed string that will store the encoded output; if NULL, a new managed string will be allocated and returned to the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the hex-encoded output on success.

Definition at line 124 of file hex.c.

References `hex_encode_chr()`, `log_pedantic`, `st_alloc()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, `st_length_set()`, `st_valid_avail()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `auth_login()`, and `hex_encode_opts()`.

5.21.1.8 `stringer_t* hex_encode_st_debug(stringer_t *input, size_t maxlen)`

Encode data in a human readable way, for debugging purposes.

Note:

All printable ASCII data will be displayed as-is; all other characters will be shown as formatted hex pairs.

Parameters:

input a pointer to a managed string containing the data to be formatted.

maxlen the maximum number of bytes to be displayed. If more characters are available, an ellipsis will be shown in the middle of the string to represent the abridged data, with only the leading and trailing characters returned as part of the display string.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded debug data on success.

Definition at line 178 of file hex.c.

References `chr_printable()`, `hex_encode_chr()`, `log_error`, `st_alloc()`, `st_char_get()`, `st_length_get()`, and `st_length_set()`.

5.21.1.9 `bool_t hex_valid_chr(uchar_t c)`

Determine whether a character is a valid hexadecimal (base 16) character. [hex.c](#)

Parameters:

c the character to be tested.

Returns:

true if the character is a valid hexadecimal character; false otherwise.

Definition at line 15 of file hex.c.

Referenced by `hex_count_st()`, `hex_decode_chr()`, `hex_decode_st()`, `hex_valid_st()`, `qp_decode()`, `url_decode()`, and `url_valid_st()`.

5.21.1.10 `size_t hex_valid_st(stringer_t *s)`

Determine whether a managed string is a properly formatted hex string and return the number found.

Note:

A valid hex string consists of only hexadecimal characters and whitespace, and the number of hex characters is divisible by two.

Parameters:

s the managed string to be tested.

Returns:

0 on failure, or the number of hexadecimal characters found in the managed string.

Definition at line 28 of file hex.c.

References `hex_valid_chr()`, and `st_empty_out()`.

Functions

- [stringer_t * qp_encode \(stringer_t *s\)](#)
Perform QP (quoted-printable) encoding of a string.
- [stringer_t * qp_decode \(stringer_t *s\)](#)
Perform QP (quoted-printable) decoding of a string.

5.23.1 Function Documentation

5.23.1.1 stringer_t* qp_decode (stringer_t * s)

Perform QP (quoted-printable) decoding of a string. [qp.c](#)

Parameters:

s the managed string containing data to be decoded.

Returns:

a pointer to a managed string containing the 8-bit decoded output, or NULL on failure.

Definition at line 99 of file qp.c.

References [hex_decode_chr\(\)](#), [hex_valid_chr\(\)](#), [log_pedantic](#), [st_alloc\(\)](#), [st_data_get\(\)](#), [st_empty_out\(\)](#), [st_length_get\(\)](#), and [st_length_set\(\)](#).

5.23.1.2 stringer_t* qp_encode (stringer_t * s)

Perform QP (quoted-printable) encoding of a string.

Parameters:

s a pointer to a managed string containing data to be encoded.

Returns:

a pointer to a managed string containing the QP encoded data, or NULL on failure.

Definition at line 17 of file qp.c.

References [HEAP](#), [JOINTED](#), [log_pedantic](#), [MANAGED_T](#), [PLACER](#), [QP_LINE_WRAP_LENGTH](#), [st_alloc_opts\(\)](#), [st_append](#), [st_data_get\(\)](#), and [st_empty_out\(\)](#).

5.24 src/core/encodings/url.c File Reference

```
#include "magma.h"
```

Functions

- `bool_t url_valid_chr (uchar_t c)`
Determine whether a given character is a valid character in a URL.
- `size_t url_valid_st (stringer_t *s)`
Check a URL string for validity.
- `stringer_t * url_encode (stringer_t *s)`
Encode a data buffer as a valid URL component.
- `stringer_t * url_decode (stringer_t *s)`
Decode a URL-encoded string into its original representation.

5.24.1 Function Documentation

5.24.1.1 stringer_t* url_decode (stringer_t * s)

Decode a URL-encoded string into its original representation.

Parameters:

s a managed string containing the UR componentL to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the original data represented by the URL-encoded input on success.

Definition at line 127 of file url.c.

References `hex_decode_chr()`, `hex_valid_chr()`, `log_pedantic`, `st_alloc()`, `st_data_get()`, `st_empty_out()`, `st_length_get()`, and `st_length_set()`.

5.24.1.2 stringer_t* url_encode (stringer_t * s)

Encode a data buffer as a valid URL component.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the fully-escaped string suitable for use in a URL.

Definition at line 65 of file url.c.

References `HEAP`, `JOINTED`, `log_pedantic`, `MANAGED_T`, `PLACER`, `st_alloc_opts()`, `st_append`, `st_data_get()`, `st_empty_out()`, `st_length_set()`, and `url_valid_chr()`.

5.24.1.3 `bool_t url_valid_chr (uchar_t c)`

Determine whether a given character is a valid character in a URL. [url.c](#)

Parameters:

`c` the character to be examined.

Returns:

true if the character is valid in a URL or false if it must be escaped.

Definition at line 15 of file `url.c`.

Referenced by `url_encode()`, and `url_valid_st()`.

5.24.1.4 `size_t url_valid_st (stringer_t * s)`

Check a URL string for validity.

Note:

This function confirms that the URL consists of only legal characters and that all escaped sequences are also valid.

Parameters:

`s` a managed string containing the URL to be verified.

Returns:

0 on failure, or the number of valid characters in the URL if the string is valid.

Definition at line 28 of file `url.c`.

References `hex_valid_chr()`, `st_empty_out()`, and `url_valid_chr()`.

5.25 src/core/encodings/zbase32.c File Reference

```
#include "magma.h"
```

Functions

- [stringer_t * zbase32_encode \(stringer_t *s\)](#)
Encode data as a zbase32 string.
- [stringer_t * zbase32_decode \(stringer_t *s\)](#)
Decode a zbase32 string.

5.25.1 Function Documentation

5.25.1.1 stringer_t* zbase32_decode (stringer_t * s)

Decode a zbase32 string. [zbase32.c](#)

Parameters:

s a managed string containing the data to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-decoded data on success.

Definition at line 64 of file [zbase32.c](#).

References [log_pedantic](#), [mappings](#), [st_alloc\(\)](#), [st_data_get\(\)](#), [st_empty_out\(\)](#), [st_free\(\)](#), [st_length_set\(\)](#), [mappings_t::values](#), and [mappings_t::zbase32](#).

Referenced by [sess_get\(\)](#).

5.25.1.2 stringer_t* zbase32_encode (stringer_t * s)

Encode data as a zbase32 string.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-encoded data on success.

Definition at line 16 of file [zbase32.c](#).

References [mappings_t::characters](#), [log_pedantic](#), [mappings](#), [st_alloc\(\)](#), [st_data_get\(\)](#), [st_empty_out\(\)](#), [st_length_set\(\)](#), and [mappings_t::zbase32](#).

Referenced by [sess_token\(\)](#).

5.26 src/core/host/backtrace.c File Reference

A simple function for dumping a stack trace to standard output. `#include "magma.h"`

Functions

- [int_t backtrace_print](#) (void)

Print the current stack backtrace to stdout.

5.26.1 Detailed Description

A simple function for dumping a stack trace to standard output.

Definition in file [backtrace.c](#).

5.26.2 Function Documentation

5.26.2.1 int_t backtrace_print (void)

Print the current stack backtrace to stdout. [backtrace.c](#)

Note:

This function was created because `backtrace_symbols()` can fail due to heap corruption.

Returns:

-1 if the backtrace failed, or 0 on success.

Definition at line 15 of file `backtrace.c`.

Functions

- void `http_print_301` (`connection_t` *con, `chr_t` *location, `int_t` tls)
Redirect the browser to a new location with an HTTP 301 response.
- void `http_print_400` (`connection_t` *con)
Return an HTTP 400 bad client request response to the client.
- void `http_print_403` (`connection_t` *con)
Return an HTTP 403 access denied response to the client.
- void `http_print_404` (`connection_t` *con)
Return an HTTP 404 location not found response to the client.
- void `http_print_405` (`connection_t` *con)
Return an HTTP 405 method not allowed response to the client.
- void `http_print_500` (`connection_t` *con)
Return an HTTP 500 internal server error response to the client.
- void `http_print_500_log` (`connection_t` *con, `chr_t` *logmsg)
Return an HTTP 500 internal server error response to the client, with additional logging information.
- void `http_print_501` (`connection_t` *con)
Return an HTTP 501 method not implemented response to the client.

5.29.1 Function Documentation

5.29.1.1 void http_print_301 (connection_t * con, chr_t * location, int_t tls)

Redirect the browser to a new location with an HTTP 301 response. errors.c

Note:

SSL downgrades are not possible; in order for an ssl upgrade, magma.web.ssl_redirect must first be set.

Parameters:

con the client's http connection handle.
location the url to which the client will be redirected.
tls if 1, direct to `https://` else direct to `http://` address.

Returns:

This function returns no value.

LOW: This function should probably move to the response file and be updated to use the cookie/xss helper functions.

Definition at line 18 of file errors.c.

References `con_print()`, `con_secure()`, `HTTP_COMPLETE`, `http_print_403()`, `http_print_500()`, `log_pedantic`, `magma`, `st_char_get()`, `st_cleanup`, `st_duped()`, `st_free()`, `st_length_int()`, `st_merge`, `magma_t::tls_redirect`, and `magma_t::web`.

Referenced by `contact_process()`, `portal_endpoint()`, `portal_process()`, `portal_upload()`, `register_process()`, and `teacher_process()`.

5.29.1.2 void http_print_400 (connection_t * con)

Return an HTTP 400 bad client request response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 80 of file `errors.c`.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.29.1.3 void http_print_403 (connection_t * con)

Return an HTTP 403 access denied response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 94 of file `errors.c`.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_print_301()`, and `http_requeue()`.

5.29.1.4 void http_print_404 (connection_t * con)

Return an HTTP 404 location not found response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 108 of file `errors.c`.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.29.1.5 void http_print_405 (connection_t * con)

Return an HTTP 405 method not allowed response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 122 of file errors.c.

References con_write_st(), HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.29.1.6 void http_print_500 (connection_t * con)

Return an HTTP 500 internal server error response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 136 of file errors.c.

References con_write_st(), HTTP_CONNECTION_CLOSE, http_response_header(), log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, and PLACER.

Referenced by contact_print_message(), http_print_301(), http_requeue(), portal_print_login(), register_print_captcha(), register_print_message(), register_print_step3(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.29.1.7 void http_print_500_log (connection_t * con, chr_t * logmsg)

Return an HTTP 500 internal server error response to the client, with additional logging information.

Parameters:

con the client's http connection handle.

logmsg a pointer to a null-terminated string with an message describing the cause of the http 500 error.

Returns:

This function returns no value.

Definition at line 154 of file errors.c.

References con_write_st(), HTTP_CONNECTION_CLOSE, http_response_header(), log_options, M_LOG_CRITICAL, and PLACER.

Referenced by contact_print_message(), register_print_step1(), and register_print_step2().

5.29.1.8 void http_print_501 (connection_t * con)

Return an HTTP 501 method not implemented response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 169 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.30 src/core/host/files.c File Reference

```
#include "magma.h"
```

Functions

- [int_t file_read](#) (const char *name, [stringer_t](#) *output)
Get the contents of a file on disk.
- [stringer_t * file_load](#) (const char *name)
Get the contents of a file on disk.
- [int_t file_temp_handle](#) ([chr_t](#) *pdir, [stringer_t](#) **tmpname)
Get a file handle to a temporary file created in a specified directory.
- [bool_t file_accessible](#) (const [chr_t](#) *path)
Determine whether a given filename or directory path is accessible by a user.
- [bool_t file_readwritable](#) (const [chr_t](#) *path)
Determine whether a given filename or directory path is readable and writable by a user.
- [bool_t file_world_accessible](#) (const [chr_t](#) *path)
Determine whether a given filename or directory path is readable or writable by other users.

5.30.1 Function Documentation

5.30.1.1 [bool_t file_accessible](#) (const [chr_t](#) * *path*)

Determine whether a given filename or directory path is accessible by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for existence/access.

Returns:

true if the pathname exists and is readable, or false otherwise.

Definition at line 155 of file files.c.

5.30.1.2 [stringer_t* file_load](#) (const char * *name*)

Get the contents of a file on disk. [files.c](#)

Parameters:

name a character pointer to the full pathname of the file to be opened.

Returns:

NULL on failure, or a managed string containing all the data in the file.

Definition at line 51 of file files.c.

References [log_info](#), [st_alloc\(\)](#), [st_avail_get\(\)](#), [st_data_get\(\)](#), and [st_length_set\(\)](#).

Referenced by [config_load_file_settings\(\)](#), [dkim_start\(\)](#), and [prime_start\(\)](#).

5.30.1.3 `int_t file_read (const char * name, stringer_t * output)`

Get the contents of a file on disk.

See also:

[file_load\(\)](#)

Note:

This is similar in function to [file_load\(\)](#) but there is no `read()` length checking, so it can be used on non-regular files.

Parameters:

name a character pointer to the full pathname of the file to be opened.

output a managed string where the results of the file read operation will be stored.

Returns:

-1 on failure or the number of bytes read from the file on success.

Definition at line 18 of file files.c.

References `log_info`, `log_pedantic`, `MEMORYBUF`, `st_avail_get()`, `st_data_get()`, and `st_length_set()`.

Referenced by `process_find_pid()`, and `process_kill()`.

5.30.1.4 `bool_t file_readwritable (const chr_t * path)`

Determine whether a given filename or directory path is readable and writable by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for permissions.

Returns:

true if the pathname exists and is readable and writable, or false otherwise.

Definition at line 165 of file files.c.

Referenced by `servers_validate()`.

5.30.1.5 `int_t file_temp_handle (chr_t * pdir, stringer_t ** tmpname)`

Get a file handle to a temporary file created in a specified directory.

Parameters:

pdir the parent directory in which to create the temporary file, or NULL for the default spool dir.

tmpname an optional pointer to a managed string to receive the name of the created temp file.

Returns:

-1 on failure or the new temporary file's file descriptor on success.

Definition at line 98 of file files.c.

References `CONSTANT`, `HEAP`, `JOINTED`, `log_pedantic`, `MAGMA_SPOOL_BASE`, `MANAGED_T`, `ns_length_get()`, `spool_path()`, `st_append`, `st_char_get()`, `st_dupe()`, `st_dupe_opts()`, `st_free()`, and `st_import()`.

5.30.1.6 bool_t file_world_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is readable or writable by other users.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for world permissions.

Returns:

true if the pathname exists and is readable or writable by others, or false otherwise.

Definition at line 175 of file files.c.

Referenced by dkim_start(), prime_start(), and servers_validate().

5.31 src/core/host/folder.c File Reference

```
#include "magma.h"
```

Functions

- [int_t folder_exists](#) ([stringer_t](#) *path, [bool_t](#) create)
Check to see if a specified directory exists, or if specified, create it if it doesn't exist.
- [int_t folder_count](#) ([stringer_t](#) *path, [bool_t](#) recursive, [bool_t](#) strict)
Count the number of files in a folder.

5.31.1 Function Documentation

5.31.1.1 int_t folder_count (stringer_t * path, bool_t recursive, bool_t strict)

Count the number of files in a folder. [folder.c](#)

Definition at line 39 of file folder.c.

References [count](#), [folder_count\(\)](#), [log_info](#), [MEMORYBUF](#), [NULLER](#), [PLACER](#), [st_char_get\(\)](#), [st_cmp_cs_ends\(\)](#), [st_cmp_cs_eq\(\)](#), [st_empty](#), [st_free\(\)](#), and [st_merge](#).

Referenced by [folder_count\(\)](#).

5.31.1.2 int_t folder_exists (stringer_t * path, bool_t create)

Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

Parameters:

path a managed string containing the full pathname of the directory.

create if true, attempt to create the directory if it does not already exist.

Returns:

-1 if the directory doesn't exist or couldn't be created, 0 if the directory exists, or 1 if the directory was created.

Definition at line 16 of file folder.c.

References [st_char_get\(\)](#).

Referenced by [log_start\(\)](#), and [spool_check\(\)](#).

5.32 src/core/host/host.c File Reference

```
#include "magma.h"
```

Functions

- [stringer_t * host_platform](#) ([stringer_t](#) *output)
Get a description of the local operating system.
- [stringer_t * host_version](#) ([stringer_t](#) *output)
Get release information about the local OS.

5.32.1 Function Documentation

5.32.1.1 [stringer_t * host_platform](#) ([stringer_t](#) * *output*)

Get a description of the local operating system. [host.c](#)

Parameters:

output a pointer to a managed string to receive the OS description.

Returns:

NULL on failure, or the user-specified managed string containing the OS info on success.

Definition at line 15 of file [host.c](#).

References [log_pedantic](#), [ns_length_get\(\)](#), [st_avail_get\(\)](#), and [st_sprint\(\)](#).

Referenced by [lib_load\(\)](#).

5.32.1.2 [stringer_t * host_version](#) ([stringer_t](#) * *output*)

Get release information about the local OS.

Parameters:

output a pointer to a managed string to receive the release information.

Returns:

NULL on failure, or the user-specified managed string containing the release info on success.

Definition at line 41 of file [host.c](#).

References [log_pedantic](#), [ns_length_get\(\)](#), [st_avail_get\(\)](#), and [st_sprint\(\)](#).

Referenced by [lib_load\(\)](#).

tcp.c
- [stringer_t](#) * [tcp_addr_st](#) (int sockd, [stringer_t](#) *output)
- int [tcp_continue](#) (int sockd, int result, int syserror)
Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.
- [int_t tcp_error](#) (int error)
Determine whether the error is a permanent/fatal failure, or a transient error.
- int [tcp_read](#) (int sockd, void *buffer, int length, [bool_t](#) block)
Read data from a TCP/IP network socket.
- [int_t tcp_status](#) (int sockd)
Determine whether the socket connection provided by sockd is still valid.
- int [tcp_wait](#) (int sockd)
Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.
- int [tcp_write](#) (int sockd, const void *buffer, int length, [bool_t](#) block)
Write data to an open TCP/IP network socket.
- [stringer_t](#) * [host_platform](#) ([stringer_t](#) *output)
host.c
- [stringer_t](#) * [host_version](#) ([stringer_t](#) *output)
Get release information about the local OS.

folder.c
- [int_t folder_exists](#) ([stringer_t](#) *path, [bool_t](#) create)
Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

- `pid_t process_find_pid (stringer_t *name)`
process.c
- `int_t process_kill (stringer_t *name, int_t signum, int_t wait)`
Kill a named process with the specified signal, and retry if necessary.
- `pid_t process_my_pid (void)`
Return the current process identifier using appropriate function for the current system.
- `int_t spool_check (stringer_t *path)`
spool.c
- `int_t spool_check_file (const char *file, const struct stat *info, int type)`
An internal function used by the `ftw()` function to cleanup the file contents of a spool directory.
- `int_t spool_cleanup (void)`
Clean up the file contents in the spool base directory.
- `uint64_t spool_error_stats (void)`
Get the number of spool errors encountered.
- `int_t spool_mktemp (int_t spool, chr_t *prefix)`
Create a temporary file in a specified spool directory.
- `stringer_t * spool_path (int_t spool)`
Get the full path to a requested spool directory.
- `bool_t spool_start (void)`
Create and check the spool directories, and clean them for use.
- `void spool_stop (void)`
Clean up the file contents in the spool base directory.
- `bool_t ip_addr_eq (ip_t *ip1, ip_t *ip2)`
ip.c
- `ip_t * ip_copy (ip_t *dst, ip_t *src)`
Create a copy of an IP address object.
- `int_t ip_family (ip_t *address)`
An abstract method of retrieving the address family for an IP structure.
- `bool_t ip_localhost (ip_t *address)`
Determine whether an IP address matches the localhost loopback address.
- `bool_t ip_matches_subnet (subnet_t *subnet, ip_t *addr)`
Determines whether a given IP address matches a subnet mask.
- `octet_t ip_octet (ip_t *address, int_t position)`
Extract a specified 8 bit octet from an IPv4 or IPv6 address.
- `stringer_t * ip_presentation (ip_t *address, stringer_t *output)`
Convert an IP address structure into a readable string.

- `bool_t ip_private (ip_t *address)`
Determine whether an IP address appears to be associated with a non-routeable, private address space.
- `stringer_t * ip_reversed (ip_t *address, stringer_t *output)`
Get a reversed-IP string, for use in an RBL lookup.
- `segment_t ip_segment (ip_t *address, int_t position)`
Extract a specified 16 bit segment from an IPv4 or IPv6 address.
- `stringer_t * ip_standard (ip_t *address, stringer_t *output)`
Convert an IP address structure to string representation.
- `bool_t ip_addr_st (chr_t *ipstr, ip_t *out)`
Convert a string into an IP address object.
- `bool_t ip_subnet_st (chr_t *substr, subnet_t *out)`
Convert a string to an IP address object.
- `stringer_t * ip_subnet (ip_t *address, stringer_t *output)`
Display the simple subnet string for an IP address.
- `int8_t ip_type (ip_t *address)`
Determine whether a structure holds an IPv4 or IPv6 address.
- `uint32_t ip_word (ip_t *address, int_t position)`
Get a specified 32-bit segment of an IP address.

5.33.1 Define Documentation

5.33.1.1 `#define MAGMA_COLOR_BLUE "\033[0;34m"`

Definition at line 16 of file host.h.

Referenced by `color_blue()`.

5.33.1.2 `#define MAGMA_COLOR_BLUE_BOLD "\033[1;34m"`

Definition at line 24 of file host.h.

Referenced by `color_blue_bold()`.

5.33.1.3 `#define MAGMA_COLOR_BLUE_INTENSE "\033[0;94m"`

Definition at line 40 of file host.h.

Referenced by `color_blue_intense()`.

5.33.1.4 `#define MAGMA_COLOR_BLUE_INTENSE_BOLD "\033[1;94m"`

Definition at line 48 of file host.h.

Referenced by `color_blue_intense_bold()`.

5.33.1.5 #define MAGMA_COLOR_BLUE_UNDERLINE "\033[4;34m"

Definition at line 32 of file host.h.

Referenced by color_blue_underline().

5.33.4 Function Documentation

5.33.4.1 `int_t backtrace_print (void)`

[backtrace.c](#) [backtrace.c](#)

Note:

This function was created because `backtrace_symbols()` can fail due to heap corruption.

Returns:

-1 if the backtrace failed, or 0 on success.

Definition at line 15 of file backtrace.c.

5.33.4.2 `const chr_t* color_blue (void)`

[color.c](#)

Definition at line 44 of file color.c.

References `color_supported()`, and `MAGMA_COLOR_BLUE`.

5.33.4.3 `const chr_t* color_blue_bold (void)`

Definition at line 72 of file color.c.

References `color_supported()`, and `MAGMA_COLOR_BLUE_BOLD`.

5.33.4.4 `const chr_t* color_blue_intense (void)`

Definition at line 128 of file color.c.

References `color_supported()`, and `MAGMA_COLOR_BLUE_INTENSE`.

5.33.4.5 `const chr_t* color_blue_intense_bold (void)`

Definition at line 156 of file color.c.

References `color_supported()`, and `MAGMA_COLOR_BLUE_INTENSE_BOLD`.

5.33.4.6 `const chr_t* color_blue_underline (void)`

Definition at line 100 of file color.c.

References `color_supported()`, and `MAGMA_COLOR_BLUE_UNDERLINE`.

5.33.4.7 `const chr_t* color_cyan (void)`

Definition at line 52 of file color.c.

References `color_supported()`, and `MAGMA_COLOR_CYAN`.

5.33.4.8 const chr_t* color_cyan_bold (void)

Definition at line 80 of file color.c.

References color_supported(), and MAGMA_COLOR_CYAN_BOLD.

5.33.4.9 const chr_t* color_cyan_intense (void)

Definition at line 136 of file color.c.

References color_supported(), and MAGMA_COLOR_CYAN_INTENSE.

5.33.4.10 const chr_t* color_cyan_intense_bold (void)

Definition at line 164 of file color.c.

References color_supported(), and MAGMA_COLOR_CYAN_INTENSE_BOLD.

5.33.4.11 const chr_t* color_cyan_underline (void)

Definition at line 108 of file color.c.

References color_supported(), and MAGMA_COLOR_CYAN_UNDERLINE.

5.33.4.12 const chr_t* color_green (void)

Definition at line 36 of file color.c.

References color_supported(), and MAGMA_COLOR_GREEN.

5.33.4.13 const chr_t* color_green_bold (void)

Definition at line 64 of file color.c.

References color_supported(), and MAGMA_COLOR_GREEN_BOLD.

5.33.4.14 const chr_t* color_green_intense (void)

Definition at line 120 of file color.c.

References color_supported(), and MAGMA_COLOR_GREEN_INTENSE.

5.33.4.15 const chr_t* color_green_intense_bold (void)

Definition at line 148 of file color.c.

References color_supported(), and MAGMA_COLOR_GREEN_INTENSE_BOLD.

5.33.4.16 const chr_t* color_green_underline (void)

Definition at line 92 of file color.c.

References color_supported(), and MAGMA_COLOR_GREEN_UNDERLINE.

5.33.4.17 const chr_t* color_purple (void)

Definition at line 48 of file color.c.

References color_supported(), and MAGMA_COLOR_PURPLE.

5.33.4.18 const chr_t* color_purple_bold (void)

Definition at line 76 of file color.c.

References color_supported(), and MAGMA_COLOR_PURPLE_BOLD.

5.33.4.19 const chr_t* color_purple_intense (void)

Definition at line 132 of file color.c.

References color_supported(), and MAGMA_COLOR_PURPLE_INTENSE.

5.33.4.20 const chr_t* color_purple_intense_bold (void)

Definition at line 160 of file color.c.

References color_supported(), and MAGMA_COLOR_PURPLE_INTENSE_BOLD.

5.33.4.21 const chr_t* color_purple_underline (void)

Definition at line 104 of file color.c.

References color_supported(), and MAGMA_COLOR_PURPLE_UNDERLINE.

5.33.4.22 const chr_t* color_red (void)

Definition at line 32 of file color.c.

References color_supported(), and MAGMA_COLOR_RED.

5.33.4.23 const chr_t* color_red_bold (void)

Definition at line 60 of file color.c.

References color_supported(), and MAGMA_COLOR_RED_BOLD.

5.33.4.24 const chr_t* color_red_intense (void)

Definition at line 116 of file color.c.

References color_supported(), and MAGMA_COLOR_RED_INTENSE.

5.33.4.25 const chr_t* color_red_intense_bold (void)

Definition at line 144 of file color.c.

References color_supported(), and MAGMA_COLOR_RED_INTENSE_BOLD.

5.33.4.26 const chr_t* color_red_underline (void)

Definition at line 88 of file color.c.

References color_supported(), and MAGMA_COLOR_RED_UNDERLINE.

5.33.4.27 const chr_t* color_reset (void)

Definition at line 28 of file color.c.

References color_supported(), and MAGMA_COLOR_RESET.

5.33.4.28 bool_t color_supported (void)

5.33.4.38 const chr_t* color_yellow_underline (void)

Definition at line 96 of file color.c.

References color_supported(), and MAGMA_COLOR_YELLOW_UNDERLINE.

5.33.4.39 chr_t* errno_name (int *error*)

errors.c

Definition at line 181 of file errors.c.

References MAGMA_E2BIG, MAGMA_EACCES, MAGMA_EAGAIN, MAGMA_EBADF, MAGMA_EBUSY, MAGMA_ECHILD, MAGMA_EEXIST, MAGMA_EFAULT, MAGMA_EFBIG, MAGMA_EINTR, MAGMA_EINVAL, MAGMA_EIO, MAGMA_EISDIR, MAGMA_EMFILE, MAGMA_EMLINK, MAGMA_ENFILE, MAGMA_ENODEV, MAGMA_ENOENT, MAGMA_ENOEXEC, MAGMA_ENOMEM, MAGMA_ENOSPC, MAGMA_ENOTBLK, MAGMA_ENOTDIR, MAGMA_ENOTTY, MAGMA_ENXIO, MAGMA_EPERM, MAGMA_EPIPE, MAGMA_EROFS, MAGMA_ESPIPE, MAGMA_ESRCH, MAGMA_ETXTBSY, and MAGMA_EXDEV.

Referenced by tcp_continue(), tls_continue(), and tls_server_alloc().

5.33.4.40 bool_t file_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is accessible by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for existence/access.

Returns:

true if the pathname exists and is readable, or false otherwise.

Definition at line 155 of file files.c.

5.33.4.41 stringer_t* file_load (const char * *name*)

[files.c files.c](#)

Parameters:

name a character pointer to the full pathname of the file to be opened.

Returns:

NULL on failure, or a managed string containing all the data in the file.

Definition at line 51 of file files.c.

References [log_info](#), [st_alloc\(\)](#), [st_avail_get\(\)](#), [st_data_get\(\)](#), and [st_length_set\(\)](#).

Referenced by [config_load_file_settings\(\)](#), [dkim_start\(\)](#), and [prime_start\(\)](#).

5.33.4.42 int_t file_read (const char * *name*, stringer_t * *output*)

Get the contents of a file on disk.

See also:

[file_load\(\)](#)

Note:

This is similar in function to [file_load\(\)](#) but there is no [read\(\)](#) length checking, so it can be used on non-regular files.

Parameters:

name a character pointer to the full pathname of the file to be opened.

output a managed string where the results of the file read operation will be stored.

Returns:

-1 on failure or the number of bytes read from the file on success.

Definition at line 18 of file files.c.

References [log_info](#), [log_pedantic](#), [MEMORYBUF](#), [st_avail_get\(\)](#), [st_data_get\(\)](#), and [st_length_set\(\)](#).

Referenced by [process_find_pid\(\)](#), and [process_kill\(\)](#).

5.33.4.43 bool_t file_readwritable (const chr_t * *path*)

Determine whether a given filename or directory path is readable and writable by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for permissions.

Returns:

true if the pathname exists and is readable and writable, or false otherwise.

Definition at line 165 of file files.c.

Referenced by [servers_validate\(\)](#).

5.33.4.44 int_t file_temp_handle (chr_t * *pdir*, stringer_t ** *tmpname*)

Get a file handle to a temporary file created in a specified directory.

Parameters:

pdir the parent directory in which to create the temporary file, or NULL for the default spool dir.
tmpname an optional pointer to a managed string to receive the name of the created temp file.

Returns:

-1 on failure or the new temporary file's file descriptor on success.

Definition at line 98 of file files.c.

References CONSTANT, HEAP, JOINTED, log_pedantic, MAGMA_SPOOL_BASE, MANAGED_T, ns_length_get(), spool_path(), st_append, st_char_get(), st_dupe(), st_dupe_opts(), st_free(), and st_import().

5.33.4.45 bool_t file_world_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is readable or writable by other users.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for world permissions.

Returns:

true if the pathname exists and is readable or writable by others, or false otherwise.

Definition at line 175 of file files.c.

Referenced by dkim_start(), prime_start(), and servers_validate().

5.33.4.46 int_t folder_count (stringer_t * *path*, bool_t *recursive*, bool_t *strict*)

[folder.c](#)

Definition at line 39 of file folder.c.

References count, folder_count(), log_info, MEMORYBUF, NULLER, PLACER, st_char_get(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_empty, st_free(), and st_merge.

Referenced by folder_count().

5.33.4.47 int_t folder_exists (stringer_t * *path*, bool_t *create*)

Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

Parameters:

path a managed string containing the full pathname of the directory.
create if true, attempt to create the directory if it does not already exist.

Returns:

-1 if the directory doesn't exist or couldn't be created, 0 if the directory exists, or 1 if the directory was created.

Definition at line 16 of file folder.c.

References st_char_get().

Referenced by log_start(), and spool_check().

5.33.4.48 stringer_t* host_platform (stringer_t * *output*)

[host.c](#) [host.c](#)

Parameters:

output a pointer to a managed string to receive the OS description.

Returns:

NULL on failure, or the user-specified managed string containing the OS info on success.

Definition at line 15 of file host.c.

References `log_pedantic`, `ns_length_get()`, `st_avail_get()`, and `st_sprint()`.

Referenced by `lib_load()`.

5.33.4.49 stringer_t* host_version (stringer_t * *output*)

Get release information about the local OS.

Parameters:

output a pointer to a managed string to receive the release information.

Returns:

NULL on failure, or the user-specified managed string containing the release info on success.

Definition at line 41 of file host.c.

References `log_pedantic`, `ns_length_get()`, `st_avail_get()`, and `st_sprint()`.

Referenced by `lib_load()`.

5.33.4.50 bool_t ip_addr_eq (ip_t * *ip1*, ip_t * *ip2*)

[ip.c](#) [ip.c](#)

Parameters:

ip1 a pointer to the first ip address object in the comparison.

ip2 a pointer to the second ip address object in the comparison.

Returns:

true if the two addresses are equal, or false if they are not.

Definition at line 485 of file ip.c.

References `ip_t::family`, `ip_t::ip4`, and `ip_t::ip6`.

Referenced by `sess_get()`.

5.33.4.51 bool_t ip_addr_st (chr_t * *ipstr*, ip_t * *out*)

Convert a string into an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.

out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 507 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, and ns_length_get().

Referenced by ip_subnet_st().

5.33.4.52 ip_t* ip_copy (ip_t * dst, ip_t * src)

Create a copy of an IP address object.

Parameters:

dst a pointer to the destination IP address object to receive the copy.

src a pointer to the source IP address object to be copied.

NULL on failure, or a pointer to the destination IP address buffer on success.

Definition at line 153 of file ip.c.

References mm_copy().

Referenced by ip_subnet_st(), and sess_create().

5.33.4.53 int_t ip_family (ip_t * address)

An abstract method of retrieving the address family for an IP structure.

Returns:

returns a value between AF_UNSPEC (typically defined as 0) and AF_MAX, if an invalid family value is encountered outside this range, then it will be replaced with AF_UNSPEC. If an invalid address structure is provided, -1 will be returned.

Definition at line 17 of file ip.c.

References ip_t::family.

Referenced by ip_type().

5.33.4.54 bool_t ip_localhost (ip_t * address)

Determine whether an IP address matches the localhost loopback address.

Note:

This function only matches if the remote peer is connected using IPv4 from the 127.0.0.0/8 range, from the same range using an IPv4 to IPv6 mapping, or from the specific IPv6 using IPv6 from the ::1/128 address by IPv6.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from the local host, and thus dictating that the packets associated with the connection never travel across a network cable, which allows us to exempt the peer from transport security requirements, SPF checks. and allow the use of administrative functions without authentication. In theory connections from IP addresses associated with the network interfaces on the local host are just as safe, but we currently only match against the loopback address.

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 75 of file ip.c.

References ip_t::ip6, ip_octet(), ip_type(), and ip_word().

Referenced by con_localhost(), con_private(), and ip_private().

5.33.4.55 bool_t ip_matches_subnet (subnet_t * *subnet*, ip_t * *addr*)

Determines whether a given IP address matches a subnet mask.

Parameters:

subnet a pointer to a subnet that the address will be compared against.

addr a pointer to the IP address of interest.

Returns:

true if the specified IP address falls into the subnet, or false if it does not.

Definition at line 617 of file ip.c.

References subnet_t::address, ip_t::family, ip_t::ip, and subnet_t::mask.

Referenced by smtp_bypass_check().

5.33.4.56 octet_t ip_octet (ip_t * *address*, int_t *position*)

Extract a specified 8 bit octet from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the zero-indexed (starting at least-significant byte) byte number of the IP address to be evaluated.

Returns:

-1 on failure, or the 16 bit-widened octet extracted from the supplied IP address.

Definition at line 168 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_octet(), ip_localhost(), and ip_private().

5.33.4.57 stringer_t* ip_presentation (ip_t * *address*, stringer_t * *output*)

Convert an IP address structure into a readable string.

Parameters:

address a pointer to the IP address to be displayed.

output a managed string to store the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the IP address as text on success.

Definition at line 296 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, MEMORYBUF, ns_length_get(), st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by client_read(), client_read_line(), client_write(), con_addr_presentation(), net_trigger(), and tcp_addr_st().

5.33.4.58 bool_t ip_private (ip_t * address)

Determine whether an IP address appears to be associated with a non-routeable, private address space.

Note:

This function looks for the IP addresses in the address ranges set aside for private networks. For IPv4 the ranges 10.0.0.0/8, 172.16.0.0/12 and 192.168.0.0/16 are reserved. For IPv6 the range fc00::/7 has been set aside. By convention addresses in these ranges are unroutable on the open internet, so if a peer appears to be connecting from a private address then it should be on the same private network.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from hosts on the same (internal) network, and thus treat those connections differently than connections from the public internet.

Returns:

false by default, and true if the address falls inside the ranges reserved for private networks.

Definition at line 106 of file ip.c.

References ip_t::ip6, ip_localhost(), ip_octet(), ip_type(), and ip_word().

5.33.4.59 stringer_t* ip_reversed (ip_t * address, stringer_t * output)

Get a reversed-IP string, for use in an RBL lookup.

Parameters:

address a pointer to the IP address to be displayed as a string.

output a pointer to the managed string to receive the reversed-IP string, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing the reversed-IP string on success.

Definition at line 413 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_length_set(), st_sprint(), st_valid_destination(), and st_valid_tracked().

Referenced by con_addr_reversed().

5.33.4.60 segment_t ip_segment (ip_t * address, int_t position)

Extract a specified 16 bit segment from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the 0-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 193 of file ip.c.

References `ip_t::family`, `ip_t::ip4`, and `ip_t::ip6`.

Referenced by `con_addr_segment()`.

5.33.4.61 stringer_t* ip_standard (ip_t * address, stringer_t * output)

Convert an IP address structure to string representation.

Parameters:

address a pointer to the IP address to be converted.

output a pointer to the managed string to receive the converted value, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 339 of file ip.c.

References `ip_t::family`, `ip_t::ip4`, `ip_t::ip6`, `log_pedantic`, `st_alloc()`, `st_avail_get()`, `st_char_get()`, `st_free()`, `st_length_set()`, `st_sprint()`, `st_valid_destination()`, `st_valid_tracked()`, and `st_wipe()`.

Referenced by `con_addr_standard()`.

5.33.4.62 stringer_t* ip_subnet (ip_t * address, stringer_t * output)

Display the simple subnet string for an IP address.

Note:

IPv4 addresses will yield a /24 subnet address, and IPv6 addresses will result in a /64 subnet address. Neither address will be displayed with the trailing zero-octet(s).

Parameters:

address a pointer to the ip address to be examined.

output a pointer to a managed string to receive the subnet string, or if passed as NULL, it will be allocated for the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the result on success.

Definition at line 243 of file ip.c.

References `ip_t::family`, `ip_t::ip4`, `ip_t::ip6`, `log_pedantic`, `st_alloc()`, `st_avail_get()`, `st_free()`, `st_length_get()`, `st_sprint()`, `st_valid_avail()`, and `st_valid_destination()`.

Referenced by `con_addr_subnet()`.

5.33.4.63 bool_t ip_subnet_st (chr_t * substr, subnet_t * out)

Convert a string to an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.

out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 557 of file ip.c.

References subnet_t::address, ip_t::family, ip_addr_st(), ip_copy(), subnet_t::mask, ns_free(), ns_import(), ns_length_get(), NULLER, pl_char_get(), pl_length_get(), placer_t, tok_get_count_st(), tok_get_ns(), and uint8_conv_bl().

Referenced by smtp_add_bypass_entry().

5.33.4.64 int8_t ip_type (ip_t * address)

Determine whether a structure holds an IPv4 or IPv6 address.

Returns:

returns -1 for invalid inputs, or system errors, 0 if the function isn't provided with a TCP/IP address, the number 4 if the address is IPv4 and 6 if the address is IPv6.

Definition at line 37 of file ip.c.

References ip_family().

Referenced by ip_localhost(), and ip_private().

5.33.4.65 uint32_t ip_word (ip_t * address, int_t position)

Get a specified 32-bit segment of an IP address.

Note:

This function operates on both ipv4 and ipv6 addresses.

Parameters:

address a pointer to the IP address object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

0 on error, or the specified 32-bit segment of the passed address.

Definition at line 221 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_word(), ip_localhost(), and ip_private().

5.33.4.66 pid_t process_find_pid (stringer_t * name)

process.c process.c

Note:

Only returns the first match, and will never return the process identifier for the currently running process.

Parameters:

name the name of the executable to find.

Returns:

0 if the process was not found, otherwise the a process identifier is returned.

Definition at line 23 of file process.c.

References chr_numeric(), file_read(), int32_conv_ns(), log_pedantic, MAGMA_FILEPATH_MAX, MAGMA_PROC_PATH, MANAGED-BUF, MEMORYBUF, pid, process_my_pid(), st_cmp_cs_eq(), and st_trim().

Referenced by main().

5.33.4.67 int_t process_kill (stringer_t * name, int_t signum, int_t wait)

Kill a named process with the specified signal, and retry if necessary.

Parameters:

name the name of the process to kill (matches any process that starts with the specified name).

signum the signal number to be sent to the matching process.

wait the number of times to re-send the signal, with one second rest intervals in between.

Returns:

-2 for a generic failure, -1 on timeout, 0 if process not found, and 1 if the process was successfully killed.

Definition at line 61 of file process.c.

References chr_numeric(), file_read(), int32_conv_ns(), log_pedantic, MAGMA_FILEPATH_MAX, MAGMA_PROC_PATH, MANAGED-BUF, MEMORYBUF, pid, process_my_pid(), st_char_get(), st_cmp_cs_starts(), st_length_int(), and st_swap().

5.33.4.68 pid_t process_my_pid (void)

Return the current process identifier using appropriate function for the current system.

Definition at line 13 of file process.c.

Referenced by process_find_pid(), process_kill(), and status_process().

5.33.4.69 chr_t* signal_name (int signal, char * buffer, size_t length)

[signals.c signals.c](#)

Parameters:

signal the input signal number.

buffer a buffer to receive the signal description.

length the length of the buffer to receive the output, which should be greater than 32 bytes.

Returns:

a pointer to a null-terminated string containing the textual name of the specified signal.

Definition at line 17 of file signals.c.

References log_pedantic, and SIGUNUSED.

Referenced by signal_segfault(), signal_shutdown(), and signal_status().

5.33.4.70 int_t spool_check (stringer_t * *path*)[spool.c](#) [spool.c](#)**Parameters:**

path a managed string with the spool directory to be checked.

Returns:

0 if the specified spool path exists, 1 if it was created, or -1 on error.

Definition at line 75 of file `spool.c`.

References `folder_exists()`, `log_critical`, `log_info`, `mutex_lock()`, `mutex_unlock()`, `st_char_get()`, and `st_length_int()`.

Referenced by `spool_mktemp()`, `spool_start()`, and `virus_start()`.

5.33.4.71 int_t spool_check_file (const char * *file*, const struct stat * *info*, int *type*)

An internal function used by the `ftw()` function to cleanup the file contents of a spool directory.

Parameters:

file a pointer to a null-terminated string containing the pathname of the spool file.

info a pointer to a stat object containing the filesystem info of the specified file.

the `ftw` type flag of the specified file (only `FTW_F` is handled).

Returns:

This function always returns 0.

Definition at line 185 of file `spool.c`.

References `log_error`, `MEMORYBUF`, `mutex_lock()`, `mutex_unlock()`, `NULLER`, `PLACER`, and `st_cmp_cs_eq()`.

Referenced by `spool_cleanup()`, and `spool_stop()`.

5.33.4.72 int_t spool_cleanup (void)

Clean up the file contents in the spool base directory.

Returns:

-1 on error or the number of files that were purged from the spool base directory.

Definition at line 213 of file `spool.c`.

References `log_error`, `log_pedantic`, `MAGMA_SPOOL_BASE`, `rwlock_lock_write()`, `rwlock_unlock()`, `spool_check_file()`, `spool_path()`, `st_char_get()`, `st_free()`, and `st_length_int()`.

Referenced by `spool_start()`.

5.33.4.73 uint64_t spool_error_stats (void)

Get the number of spool errors encountered.

Returns:

the total number of spool errors.

Definition at line 26 of file spool.c.

References mutex_lock(), and mutex_unlock().

Referenced by stats_derived_value().

5.33.4.74 int_t spool_mktemp (int_t *spool*, chr_t * *prefix*)

Create a temporary file in a specified spool directory.

Note:

The temp file is automatically unlinked as soon as it is created.

Parameters:

spool the spool directory id in which the temp file will be stored (MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, or MAGMA_SPOOL_SCAN).

prefix an optional prefix for the temp file name ("magma" will be used if prefix is NULL0).

Returns:

-1 on failure or the file descriptor to the newly created temp file on success.

Definition at line 113 of file spool.c.

References log_critical, log_pedantic, MAGMA_SPOOL_BASE, MEMORYBUF, mutex_lock(), mutex_unlock(), rand_get_uint64(), rwlock_lock_read(), rwlock_unlock(), spool_check(), spool_path(), st_aprint(), st_char_get(), st_free(), st_length_int(), and thread_get_thread_id().

Referenced by st_alloc_opts(), and virus_check().

5.33.4.75 stringer_t* spool_path (int_t *spool*)

Get the full path to a requested spool directory.

Parameters:

the spool id (MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, or MAGMA_SPOOL_SCAN); defaults to MAGMA_SPOOL_DATA.

Returns:

NULL on failure, or a managed string pointing to the requested path inside the magma spool parent directory, or /tmp/magma if the spool isn't configured.

Definition at line 40 of file spool.c.

References CONTIGUOUS, HEAP, magma, MAGMA_SPOOL_BASE, MAGMA_SPOOL_SCAN, ns_length_get(), NULLER_T, magma_t::spool, and st_merge_opts().

Referenced by dspam_check(), dspam_train(), file_temp_handle(), spool_cleanup(), spool_mktemp(), spool_start(), and virus_start().

5.33.4.76 bool_t spool_start (void)

Create and check the spool directories, and clean them for use.

Returns:

true on success or false on failure.

Definition at line 279 of file `spool.c`.

References `log_critical`, `MAGMA_SPOOL_BASE`, `MAGMA_SPOOL_DATA`, `MAGMA_SPOOL_SCAN`, `mutex_lock()`, `mutex_unlock()`, `spool_check()`, `spool_cleanup()`, `spool_path()`, `st_char_get()`, `st_free()`, and `st_length_int()`.

Referenced by `process_start()`.

5.33.4.77 `void spool_stop (void)`

Clean up the file contents in the spool base directory.

Note:

This is like a fast version of `spool_cleanup()`.

Returns:

This function returns no value.

Definition at line 252 of file `spool.c`.

References `log_pedantic`, `spool_check_file()`, `st_char_get()`, `st_free()`, and `st_length_int()`.

Referenced by `process_stop()`.

5.33.4.78 `ip_t* tcp_addr_ip (int sockd, ip_t * output)`

[tcp.c](#)

Definition at line 163 of file `tcp.c`.

References `ip_t::family`, `ip_t::ip4`, `ip_t::ip6`, `MEMORYBUF`, `mm_alloc()`, and `mm_copy()`.

Referenced by `con_init()`, and `tcp_addr_st()`.

5.33.4.79 `stringer_t* tcp_addr_st (int sockd, stringer_t * output)`

Definition at line 192 of file `tcp.c`.

References `ip_presentation()`, and `tcp_addr_ip()`.

5.33.4.80 `int tcp_continue (int sockd, int result, int syserror)`

Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

Definition at line 84 of file `tcp.c`.

References `errno_name()`, `log_pedantic`, `MEMORYBUF`, and `status`.

Referenced by `tcp_read()`, and `tcp_write()`.

5.33.4.81 `int_t tcp_error (int error)`

Determine whether the error is a permanent/fatal failure, or a transient error.

Returns:

return 0 for errors we should ignore, and -1 for permanent/fatal failures.

Definition at line 15 of file `tcp.c`.

References log_pedantic, and MEMORYBUF.

Referenced by tcp_status().

5.33.4.82 int tcp_read (int sockd, void * buffer, int length, bool_t block)

Read data from a TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll read the data from.

buffer a pointer to the buffer where the data will be stored.

length the maximum length, in bytes, we can read into the buffer.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 if the network connection is no longer viable, otherwise the number bytes read, while a 0 may indicate the connection wasn't ready (when using non-blocking read calls), or a non-network error may have occurred.

Definition at line 109 of file tcp.c.

References log_pedantic, and tcp_continue().

Referenced by con_read(), and con_read_line().

5.33.4.83 int_t tcp_status (int sockd)

Determine whether the socket connection provided by sockd is still valid.

Parameters:

sockd The socket connection being checked.

Returns:

return 0 for valid connections

Definition at line 42 of file tcp.c.

References MANAGEDBUF, st_data_get(), and tcp_error().

Referenced by client_read(), client_read_line(), client_status(), client_write(), and con_status().

5.33.4.84 int tcp_wait (int sockd)

Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.

Parameters:

sockd

Returns:

Definition at line 75 of file tcp.c.

5.33.4.85 int tcp_write (int *sockd*, const void * *buffer*, int *length*, bool_t *block*)

Write data to an open TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll write the data to.

buffer a pointer to the buffer containing the data to be written.

length the length, in bytes, of the data to be written.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 on error, or the number of bytes written to the network connection.

Definition at line 140 of file tcp.c.

References `log_pedantic`, and `tcp_continue()`.

Referenced by `con_write_bl()`.

5.34 src/core/host/ip.c File Reference

Generic interface for parsing, and manipulating the IP address structure. `#include "magma.h"`

Functions

- `int_t ip_family (ip_t *address)`
An abstract method of retrieving the address family for an IP structure.
- `int8_t ip_type (ip_t *address)`
Determine whether a structure holds an IPv4 or IPv6 address.
- `bool_t ip_localhost (ip_t *address)`
Determine whether an IP address matches the localhost loopback address.
- `bool_t ip_private (ip_t *address)`
Determine whether an IP address appears to be associated with a non-routeable, private address space.
- `ip_t * ip_copy (ip_t *dst, ip_t *src)`
Create a copy of an IP address object.
- `octet_t ip_octet (ip_t *address, int_t position)`
Extract a specified 8 bit octet from an IPv4 or IPv6 address.
- `segment_t ip_segment (ip_t *address, int_t position)`
Extract a specified 16 bit segment from an IPv4 or IPv6 address.
- `uint32_t ip_word (ip_t *address, int_t position)`
Get a specified 32-bit segment of an IP address.
- `stringer_t * ip_subnet (ip_t *address, stringer_t *output)`
Display the simple subnet string for an IP address.
- `stringer_t * ip_presentation (ip_t *address, stringer_t *output)`
Convert an IP address structure into a readable string.
- `stringer_t * ip_standard (ip_t *address, stringer_t *output)`
Convert an IP address structure to string representation.
- `stringer_t * ip_reversed (ip_t *address, stringer_t *output)`
Get a reversed-IP string, for use in an RBL lookup.
- `bool_t ip_addr_eq (ip_t *ip1, ip_t *ip2)`
Determine whether two IP addresses are equal.
- `bool_t ip_addr_st (chr_t *ipstr, ip_t *out)`
Convert a string into an IP address object.
- `bool_t ip_subnet_st (chr_t *substr, subnet_t *out)`
Convert a string to an IP address object.
- `bool_t ip_matches_subnet (subnet_t *subnet, ip_t *addr)`
Determines whether a given IP address matches a subnet mask.

5.34.1 Detailed Description

Generic interface for parsing, and manipulating the IP address structure.

Definition in file [ip.c](#).

5.34.2 Function Documentation

5.34.2.1 `bool_t ip_addr_eq (ip_t * ip1, ip_t * ip2)`

Determine whether two IP addresses are equal. [ip.c](#)

Parameters:

- ip1* a pointer to the first ip address object in the comparison.
- ip2* a pointer to the second ip address object in the comparison.

Returns:

true if the two addresses are equal, or false if they are not.

Definition at line 485 of file [ip.c](#).

References [ip_t::family](#), [ip_t::ip4](#), and [ip_t::ip6](#).

Referenced by [sess_get\(\)](#).

5.34.2.2 `bool_t ip_addr_st (chr_t * ipstr, ip_t * out)`

Convert a string into an IP address object.

Parameters:

- ipstr* a pointer to a null-terminated string containing the IP string to be parsed.
- out* a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 507 of file [ip.c](#).

References [ip_t::family](#), [ip_t::ip4](#), [ip_t::ip6](#), and [ns_length_get\(\)](#).

Referenced by [ip_subnet_st\(\)](#).

5.34.2.3 `ip_t* ip_copy (ip_t * dst, ip_t * src)`

Create a copy of an IP address object.

Parameters:

- dst* a pointer to the destination IP address object to receive the copy.
- src* a pointer to the source IP address object to be copied.
- NULL* on failure, or a pointer to the destination IP address buffer on success.

Definition at line 153 of file [ip.c](#).

References [mm_copy\(\)](#).

Referenced by [ip_subnet_st\(\)](#), and [sess_create\(\)](#).

5.34.2.4 `int_t ip_family (ip_t * address)`

An abstract method of retrieving the address family for an IP structure.

Returns:

returns a value between AF_UNSPEC (typically defined as 0) and AF_MAX, if an invalid family value is encountered outside this range, then it will be replaced with AF_UNSPEC. If an invalid address structure is provided, -1 will be returned.

Definition at line 17 of file ip.c.

References `ip_t::family`.

Referenced by `ip_type()`.

5.34.2.5 `bool_t ip_localhost (ip_t * address)`

Determine whether an IP address matches the localhost loopback address.

Note:

This function only matches if the remote peer is connected using IPv4 from the 127.0.0.0/8 range, from the same range using an IPv4 to IPv6 mapping, or from the specific IPv6 using IPv6 from the ::1/128 address by IPv6.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from the local host, and thus dictating that the packets associated with the connection never travel across a network cable, which allows us to exempt the peer from transport security requirements, SPF checks. and allow the use of administrative functions without authentication. In theory connections from IP addresses associated with the network interfaces on the local host are just as safe, but we currently only match against the loopback address.

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 75 of file ip.c.

References `ip_t::ip6`, `ip_octet()`, `ip_type()`, and `ip_word()`.

Referenced by `con_localhost()`, `con_private()`, and `ip_private()`.

5.34.2.6 `bool_t ip_matches_subnet (subnet_t * subnet, ip_t * addr)`

Determines whether a given IP address matches a subnet mask.

Parameters:

subnet a pointer to a subnet that the address will be compared against.

addr a pointer to the IP address of interest.

Returns:

true if the specified IP address falls into the subnet, or false if it does not.

Definition at line 617 of file ip.c.

References `subnet_t::address`, `ip_t::family`, `ip_t::ip`, and `subnet_t::mask`.

Referenced by `sntp_bypass_check()`.

5.34.2.7 `octet_t ip_octet (ip_t * address, int_t position)`

Extract a specified 8 bit octet from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the zero-indexed (starting at least-significant byte) byte number of the IP address to be evaluated.

Returns:

-1 on failure, or the 16 bit-widened octet extracted from the supplied IP address.

Definition at line 168 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_octet(), ip_localhost(), and ip_private().

5.34.2.8 `stringer_t* ip_presentation (ip_t * address, stringer_t * output)`

Convert an IP address structure into a readable string.

Parameters:

address a pointer to the IP address to be displayed.

output a managed string to store the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the IP address as text on success.

Definition at line 296 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, MEMORYBUF, ns_length_get(), st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by client_read(), client_read_line(), client_write(), con_addr_presentation(), net_trigger(), and tcp_addr_st().

5.34.2.9 `bool_t ip_private (ip_t * address)`

Determine whether an IP address appears to be associated with a non-routeable, private address space.

Note:

This function looks for the IP addresses in the address ranges set aside for private networks. For IPv4 the ranges 10.0.0.0/8, 172.16.0.0/12 and 192.168.0.0/16 are reserved. For IPv6 the range fc00::/7 has been set aside. By convention addresses in these ranges are unrouteable on the open internet, so if a peer appears to be connecting from a private address then it should be on the same private network.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from hosts on the same (internal) network, and thus treat those connections differently than connections from the public internet.

Returns:

false by default, and true if the address falls inside the ranges reserved for private networks.

Definition at line 106 of file ip.c.

References ip_t::ip6, ip_localhost(), ip_octet(), ip_type(), and ip_word().

5.34.2.10 stringer_t* ip_reversed(ip_t * address, stringer_t * output)

Get a reversed-IP string, for use in an RBL lookup.

Parameters:

address a pointer to the IP address to be displayed as a string.

output a pointer to the managed string to receive the reversed-IP string, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing the reversed-IP string on success.

Definition at line 413 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_length_set(), st_sprint(), st_valid_destination(), and st_valid_tracked().

Referenced by con_addr_reversed().

5.34.2.11 segment_t ip_segment(ip_t * address, int_t position)

Extract a specified 16 bit segment from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the 0-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 193 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_segment().

5.34.2.12 stringer_t* ip_standard(ip_t * address, stringer_t * output)

Convert an IP address structure to string representation.

Parameters:

address a pointer to the IP address to be converted.

output a pointer to the managed string to receive the converted value, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 339 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_sprint(), st_valid_destination(), st_valid_tracked(), and st_wipe().

Referenced by con_addr_standard().

5.34.2.13 stringer_t* ip_subnet (ip_t * *address*, stringer_t * *output*)

Display the simple subnet string for an IP address.

Note:

IPv4 addresses will yield a /24 subnet address, and IPv6 addresses will result in a /64 subnet address. Neither address will be displayed with the trailing zero-octet(s).

Parameters:

address a pointer to the ip address to be examined.

output a pointer to a managed string to receive the subnet string, or if passed as NULL, it will be allocated for the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the result on success.

Definition at line 243 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_free(), st_length_get(), st_sprint(), st_valid_avail(), and st_valid_destination().

Referenced by con_addr_subnet().

5.34.2.14 bool_t ip_subnet_st (chr_t * *substr*, subnet_t * *out*)

Convert a string to an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.

out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 557 of file ip.c.

References subnet_t::address, ip_t::family, ip_addr_st(), ip_copy(), subnet_t::mask, ns_free(), ns_import(), ns_length_get(), NULLER, pl_char_get(), pl_length_get(), placer_t, tok_get_count_st(), tok_get_ns(), and uint8_conv_bl().

Referenced by smtp_add_bypass_entry().

5.34.2.15 int8_t ip_type (ip_t * *address*)

Determine whether a structure holds an IPv4 or IPv6 address.

Returns:

returns -1 for invalid inputs, or system errors, 0 if the function isn't provided with a TCP/IP address, the number 4 if the address is IPv4 and 6 if the address is IPv6.

Definition at line 37 of file ip.c.

References ip_family().

Referenced by ip_localhost(), and ip_private().

5.34.2.16 uint32_t ip_word (ip_t * *address*, int_t *position*)

Get a specified 32-bit segment of an IP address.

Note:

This function operates on both ipv4 and ipv6 addresses.

Parameters:

address a pointer to the IP address object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

0 on error, or the specified 32-bit segment of the passed address.

Definition at line 221 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_word(), ip_localhost(), and ip_private().

5.35 src/core/host/process.c File Reference

```
#include "magma.h"
```

Functions

- `pid_t process_my_pid` (void)
Return the current process identifier using appropriate function for the current system.
- `pid_t process_find_pid` (stringer_t *name)
Find the process identifier for a named executable and return it.
- `int_t process_kill` (stringer_t *name, int_t signum, int_t wait)
Kill a named process with the specified signal, and retry if necessary.

5.35.1 Function Documentation

5.35.1.1 pid_t process_find_pid (stringer_t * name)

Find the process identifier for a named executable and return it. process.c

Note:

Only returns the first match, and will never return the process identifier for the currently running process.

Parameters:

name the name of the executable to find.

Returns:

0 if the process was not found, otherwise the a process identifier is returned.

Definition at line 23 of file process.c.

References `chr_numeric()`, `file_read()`, `int32_conv_ns()`, `log_pedantic`, `MAGMA_FILEPATH_MAX`, `MAGMA_PROC_PATH`, `MANAGED-BUF`, `MEMORYBUF`, `pid`, `process_my_pid()`, `st_cmp_cs_eq()`, and `st_trim()`.

Referenced by `main()`.

5.35.1.2 int_t process_kill (stringer_t * name, int_t signum, int_t wait)

Kill a named process with the specified signal, and retry if necessary.

Parameters:

name the name of the process to kill (matches any process that starts with the specified name).

signum the signal number to be sent to the matching process.

wait the number of times to re-send the signal, with one second rest intervals in between.

Returns:

-2 for a generic failure, -1 on timeout, 0 if process not found, and 1 if the process was successfully killed.

Definition at line 61 of file process.c.

References `chr_numeric()`, `file_read()`, `int32_conv_ns()`, `log_pedantic`, `MAGMA_FILEPATH_MAX`, `MAGMA_PROC_PATH`, `MANAGED-BUF`, `MEMORYBUF`, `pid`, `process_my_pid()`, `st_char_get()`, `st_cmp_cs_starts()`, `st_length_int()`, and `st_swap()`.

5.35.1.3 pid_t process_my_pid (void)

Return the current process identifier using appropriate function for the current system.

Definition at line 13 of file process.c.

Referenced by process_find_pid(), process_kill(), and status_process().

5.36 src/engine/context/process.c File Reference

```
#include "magma.h"
```

Functions

- void `process_maint` (void)
The entry point for the process maintenance thread, which runs in a continuous loop unless canceled.
- void `process_stop` (void)
Execute the magma shutdown routines.
- `bool_t` `process_start` (void)
Execute the magma initializations routines, making sure they all run properly.

Variables

- `bool_t` `exit_and_dump`
- `uint64_t` `day` = 0
- `pthread_t` * `maint` = NULL

5.36.1 Function Documentation

5.36.1.1 void process_maint (void)

The entry point for the process maintenance thread, which runs in a continuous loop unless canceled.

Note:

Execute once daily: rotate the log files, update the warehouse, and perform tank maintenance. Execute every few (0-10) minutes: refresh the virus engine and prune the object cache.

Returns:

This function returns no value.

Definition at line 20 of file process.c.

References `day`, `log_rotate()`, `obj_cache_prune()`, `rand_get_uint32()`, `status`, `thread_cancel_disable()`, `thread_cancel_enable()`, `thread_start()`, `thread_stop()`, `time_datestamp()`, `time_till_midnight()`, `virus_engine_refresh()`, and `warehouse_update()`.

Referenced by `process_start()`.

5.36.1.2 bool_t process_start (void)

Execute the magma initializations routines, making sure they all run properly.

Note:

If any of the init routines returns with failure, this function fails and logs an error message. Certain checks are made that the init routines are run in a particular order, especially in waiting for daemonization and privilege dropping before starting logging. The system maintenance thread is also launched from here.

Returns:

true if all starter functions returned true, or false if any of them failed..

Definition at line 163 of file process.c.

References `cache_start()`, `config_load_cmdline_settings()`, `config_load_database_settings()`, `config_load_defaults()`, `config_load_file_settings()`, `config_validate_settings()`, `deprecated_ecies_start()`, `dkim_start()`, `dspam_start()`, `exit_and_dump`, `magma_t::host`, `http_content_start()`, `magma_t::init`, `lib_load()`, `log_critical`, `log_options`, `log_start()`, `M_LOG_FILE_DISABLE`, `M_LOG_FUNCTION_DISABLE`, `M_LOG_INFO`, `M_LOG_LINE_DISABLE`, `M_LOG_STACK_TRACE_DISABLE`, `M_LOG_TIME_DISABLE`, `magma`, `MAGMA_HOSTNAME_MAX`, `mail_cache_start()`, `maint`, `mm_alloc()`, `mm_free()`, `mm_sec_start()`, `magma_t::name`, `obj_cache_start()`, `magma_t::page_length`, `prime_start()`, `process_maint()`, `protocol_init()`, `queue_init()`, `rand_start()`, `sanity_check()`, `servers_encryption_start()`, `servers_network_start()`, `signal_start()`, `spf_start()`, `spool_start()`, `sql_start()`, `ssl_start()`, `stats_init()`, `status_process()`, `system_change_root_directory()`, `system_fork_daemon()`, `system_init_core_dumps()`, `system_init_impersonation()`, `system_init_resource_limits()`, `system_init_umask()`, `tank_start()`, `thread_launch()`, `virus_start()`, `warehouse_start()`, and `xml_start()`.

Referenced by `main()`.

5.36.1.3 void process_stop (void)

Execute the magma shutdown routines.

Note:

This function will execute a shutdown routine for each of the startup initialization routines that was performed. It will also signal and terminate the maintenance thread.

Returns:

This function returns no value.

Definition at line 66 of file process.c.

References `cache_stop()`, `config_free()`, `deprecated_ecies_stop()`, `dkim_stop()`, `dspam_stop()`, `http_content_stop()`, `magma_t::init`, `lib_unload()`, `log_critical`, `log_info`, `log_options`, `log_pedantic`, `M_LOG_FILE_DISABLE`, `M_LOG_FUNCTION_DISABLE`, `M_LOG_INFO`, `M_LOG_LINE_DISABLE`, `M_LOG_STACK_TRACE_DISABLE`, `M_LOG_TIME_DISABLE`, `magma`, `mail_cache_stop()`, `maint`, `mm_free()`, `mm_sec_stop()`, `obj_cache_stop()`, `prime_stop()`, `queue_shutdown()`, `rand_stop()`, `servers_encryption_stop()`, `servers_network_stop()`, `spf_stop()`, `spool_stop()`, `sql_stop()`, `ssl_stop()`, `stats_shutdown()`, `status`, `tank_stop()`, `thread_join()`, `thread_signal()`, `virus_stop()`, `warehouse_stop()`, and `xml_stop()`.

5.37 src/core/host/signals.c File Reference

Functions to help handle signals. `#include "magma.h"`

Functions

- `chr_t * signal_name` (int *signal*, char **buffer*, size_t *length*)

Translate a numeric signal into a human readable name.

5.37.1 Detailed Description

Functions to help handle signals.

Definition in file [signals.c](#).

5.37.2 Function Documentation

5.37.2.1 `chr_t* signal_name` (int *signal*, char * *buffer*, size_t *length*)

Translate a numeric signal into a human readable name. [signals.c](#)

Parameters:

signal the input signal number.

buffer a buffer to receive the signal description.

length the length of the buffer to receive the output, which should be greater than 32 bytes.

Returns:

a pointer to a null-terminated string containing the textual name of the specified signal.

Definition at line 17 of file [signals.c](#).

References [log_pedantic](#), and [SIGUNUSED](#).

Referenced by [signal_segfault\(\)](#), [signal_shutdown\(\)](#), and [signal_status\(\)](#).

5.38 src/core/host/spool.c File Reference

```
#include "magma.h"
```

Functions

- `uint64_t spool_error_stats` (void)
Get the number of spool errors encountered.
- `stringer_t * spool_path` (int_t spool)
Get the full path to a requested spool directory.
- `int_t spool_check` (stringer_t *path)
Check to see if the specified spool directory exists.
- `int_t spool_mktemp` (int_t spool, chr_t *prefix)
Create a temporary file in a specified spool directory.
- `int_t spool_check_file` (const char *file, const struct stat *info, int type)
An internal function used by the ftw() function to cleanup the file contents of a spool directory.
- `int_t spool_cleanup` (void)
Clean up the file contents in the spool base directory.
- `void spool_stop` (void)
Clean up the file contents in the spool base directory.
- `bool_t spool_start` (void)
Create and check the spool directories, and clean them for use.

5.38.1 Function Documentation

5.38.1.1 int_t spool_check (stringer_t * path)

Check to see if the specified spool directory exists. [spool.c](#)

Parameters:

path a managed string with the spool directory to be checked.

Returns:

0 if the specified spool path exists, 1 if it was created, or -1 on error.

Definition at line 75 of file spool.c.

References [folder_exists\(\)](#), [log_critical](#), [log_info](#), [mutex_lock\(\)](#), [mutex_unlock\(\)](#), [st_char_get\(\)](#), and [st_length_int\(\)](#).

Referenced by [spool_mktemp\(\)](#), [spool_start\(\)](#), and [virus_start\(\)](#).

5.38.1.2 `int_t spool_check_file (const char *file, const struct stat *info, int type)`

An internal function used by the `ftw()` function to cleanup the file contents of a spool directory.

Parameters:

- file* a pointer to a null-terminated string containing the pathname of the spool file.
- info* a pointer to a stat object containing the filesystem info of the specified file.
- the* ftw type flag of the specified file (only FTW_F is handled).

Returns:

This function always returns 0.

Definition at line 185 of file `spool.c`.

References `log_error`, `MEMORYBUF`, `mutex_lock()`, `mutex_unlock()`, `NULLER`, `PLACER`, and `st_cmp_cs_eq()`.

Referenced by `spool_cleanup()`, and `spool_stop()`.

5.38.1.3 `int_t spool_cleanup (void)`

Clean up the file contents in the spool base directory.

Returns:

-1 on error or the number of files that were purged from the spool base directory.

Definition at line 213 of file `spool.c`.

References `log_error`, `log_pedantic`, `MAGMA_SPOOL_BASE`, `rwlock_lock_write()`, `rwlock_unlock()`, `spool_check_file()`, `spool_path()`, `st_char_get()`, `st_free()`, and `st_length_int()`.

Referenced by `spool_start()`.

5.38.1.4 `uint64_t spool_error_stats (void)`

Get the number of spool errors encountered.

Returns:

the total number of spool errors.

Definition at line 26 of file `spool.c`.

References `mutex_lock()`, and `mutex_unlock()`.

Referenced by `stats_derived_value()`.

5.38.1.5 `int_t spool_mktemp (int_t spool, chr_t *prefix)`

Create a temporary file in a specified spool directory.

Note:

The temp file is automatically unlinked as soon as it is created.

Parameters:

- spool* the spool directory id in which the temp file will be stored (`MAGMA_SPOOL_BASE`, `MAGMA_SPOOL_DATA`, or `MAGMA_SPOOL_SCAN`).

prefix an optional prefix for the temp file name ("magma" will be used if prefix is NULL0).

Returns:

-1 on failure or the file descriptor to the newly created temp file on success.

Definition at line 113 of file spool.c.

References `log_critical`, `log_pedantic`, `MAGMA_SPOOL_BASE`, `MEMORYBUF`, `mutex_lock()`, `mutex_unlock()`, `rand_get_uint64()`, `rwlock_lock_read()`, `rwlock_unlock()`, `spool_check()`, `spool_path()`, `st_aprint()`, `st_char_get()`, `st_free()`, `st_length_int()`, and `thread_get_thread_id()`.

Referenced by `st_alloc_opts()`, and `virus_check()`.

5.38.1.6 `stringer_t* spool_path (int_t spool)`

Get the full path to a requested spool directory.

Parameters:

the spool id (`MAGMA_SPOOL_BASE`, `MAGMA_SPOOL_DATA`, or `MAGMA_SPOOL_SCAN`); defaults to `MAGMA_SPOOL_DATA`.

Returns:

NULL on failure, or a managed string pointing to the requested path inside the magma spool parent directory, or `/tmp/magma` if the spool isn't configured.

Definition at line 40 of file spool.c.

References `CONTIGUOUS`, `HEAP`, `magma`, `MAGMA_SPOOL_BASE`, `MAGMA_SPOOL_SCAN`, `ns_length_get()`, `NULLER_T`, `magma_t::spool`, and `st_merge_opts()`.

Referenced by `dspam_check()`, `dspam_train()`, `file_temp_handle()`, `spool_cleanup()`, `spool_mktemp()`, `spool_start()`, and `virus_start()`.

5.38.1.7 `bool_t spool_start (void)`

Create and check the spool directories, and clean them for use.

Returns:

true on success or false on failure.

Definition at line 279 of file spool.c.

References `log_critical`, `MAGMA_SPOOL_BASE`, `MAGMA_SPOOL_DATA`, `MAGMA_SPOOL_SCAN`, `mutex_lock()`, `mutex_unlock()`, `spool_check()`, `spool_cleanup()`, `spool_path()`, `st_char_get()`, `st_free()`, and `st_length_int()`.

Referenced by `process_start()`.

5.38.1.8 `void spool_stop (void)`

Clean up the file contents in the spool base directory.

Note:

This is like a fast version of `spool_cleanup()`.

Returns:

This function returns no value.

Definition at line 252 of file spool.c.

References `log_pedantic`, `spool_check_file()`, `st_char_get()`, `st_free()`, and `st_length_int()`.

Referenced by `process_stop()`.

5.39 src/core/host/tcp.c File Reference

Generic fuctions for interaction with TCP/IP socket connections. `#include "magma.h"`

Functions

- [int_t tcp_error](#) (int error)
Determine whether the error is a permanent/fatal failure, or a transient error.
- [int_t tcp_status](#) (int sockd)
Determine whether the socket connection provided by sockd is still valid.
- [int tcp_wait](#) (int sockd)
Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.
- [int tcp_continue](#) (int sockd, int result, int syserror)
Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.
- [int tcp_read](#) (int sockd, void *buffer, int length, bool_t block)
Read data from a TCP/IP network socket.
- [int tcp_write](#) (int sockd, const void *buffer, int length, bool_t block)
Write data to an open TCP/IP network socket.
- [ip_t * tcp_addr_ip](#) (int sockd, [ip_t](#) *output)
tcp.c
- [stringer_t * tcp_addr_st](#) (int sockd, [stringer_t](#) *output)

5.39.1 Detailed Description

Generic fuctions for interaction with TCP/IP socket connections.

Definition in file [tcp.c](#).

5.39.2 Function Documentation

5.39.2.1 [ip_t* tcp_addr_ip](#) (int sockd, [ip_t](#) * output)

[tcp.c](#)

Definition at line 163 of file [tcp.c](#).

References [ip_t::family](#), [ip_t::ip4](#), [ip_t::ip6](#), [MEMORYBUF](#), [mm_alloc\(\)](#), and [mm_copy\(\)](#).

Referenced by [con_init\(\)](#), and [tcp_addr_st\(\)](#).

5.39.2.2 [stringer_t* tcp_addr_st](#) (int sockd, [stringer_t](#) * output)

Definition at line 192 of file [tcp.c](#).

References [ip_presentation\(\)](#), and [tcp_addr_ip\(\)](#).

5.39.2.3 `int tcp_continue (int sockd, int result, int syserror)`

Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

Definition at line 84 of file tcp.c.

References `errno_name()`, `log_pedantic`, `MEMORYBUF`, and `status`.

Referenced by `tcp_read()`, and `tcp_write()`.

5.39.2.4 `int_t tcp_error (int error)`

Determine whether the error is a permanent/fatal failure, or a transient error.

Returns:

return 0 for errors we should ignore, and -1 for permanent/fatal failures.

Definition at line 15 of file tcp.c.

References `log_pedantic`, and `MEMORYBUF`.

Referenced by `tcp_status()`.

5.39.2.5 `int tcp_read (int sockd, void * buffer, int length, bool_t block)`

Read data from a TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll read the data from.

buffer a pointer to the buffer where the data will be stored.

length the maximum length, in bytes, we can read into the buffer.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 if the network connection is no longer viable, otherwise the number bytes read, while a 0 may indicate the connection wasn't ready (when using non-blocking read calls), or a non-network error may have occurred.

Definition at line 109 of file tcp.c.

References `log_pedantic`, and `tcp_continue()`.

Referenced by `con_read()`, and `con_read_line()`.

5.39.2.6 `int_t tcp_status (int sockd)`

Determine whether the socket connection provided by `sockd` is still valid.

Parameters:

sockd The socket connection being checked.

Returns:

return 0 for valid connections

Definition at line 42 of file tcp.c.

References `MANAGEDBUF`, `st_data_get()`, and `tcp_error()`.

Referenced by `client_read()`, `client_read_line()`, `client_status()`, `client_write()`, and `con_status()`.

5.39.2.7 int tcp_wait (int *sockd*)

Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.

Parameters:

sockd

Returns:

Definition at line 75 of file tcp.c.

5.39.2.8 int tcp_write (int *sockd*, const void * *buffer*, int *length*, bool_t *block*)

Write data to an open TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll write the data to.

buffer a pointer to the buffer containing the data to be written.

length the length, in bytes, of the data to be written.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 on error, or the number of bytes written to the network connection.

Definition at line 140 of file tcp.c.

References `log_pedantic`, and `tcp_continue()`.

Referenced by `con_write_bl()`.

5.40 src/core/indexes/cursors.c File Reference

```
#include "magma.h"
```

Functions

- void [inx_cursor_reset](#) ([inx_cursor_t](#) *cursor)
Reset the position of an inx cursor.
- void [inx_cursor_free](#) ([inx_cursor_t](#) *cursor)
Free an inx cursor and the inx object it points to, if the inx reference count hits zero.
- [inx_cursor_t](#) * [inx_cursor_alloc](#) ([inx_t](#) *index)
Create a new cursor to iterate through an inx object.
- [multi_t](#) [inx_cursor_key_next](#) ([inx_cursor_t](#) *cursor)
Get the key at the next inx cursor position.
- [multi_t](#) [inx_cursor_key_active](#) ([inx_cursor_t](#) *cursor)
Get the key at the current inx cursor position.
- void * [inx_cursor_value_next](#) ([inx_cursor_t](#) *cursor)
Get the key at the next inx cursor position.
- void * [inx_cursor_value_active](#) ([inx_cursor_t](#) *cursor)
Get the value at the current inx cursor position.

5.40.1 Function Documentation

5.40.1.1 [inx_cursor_t](#)* [inx_cursor_alloc](#) ([inx_t](#) * *index*)

Create a new cursor to iterate through an inx object. [cursors.c](#)

Parameters:

index a pointer to the inx object to be traversed.

Returns:

NULL on failure, or a pointer to a new inx cursor for the specified inx object on success.

Definition at line 52 of file [cursors.c](#).

References [inx_auto_unlock\(\)](#), [inx_auto_write\(\)](#), and [inx_cursor_t](#).

5.40.1.2 void `inx_cursor_free` (`inx_cursor_t * cursor`)

Free an inx cursor and the inx object it points to, if the inx reference count hits zero.

Parameters:

cursor the inx cursor to be freed.

Returns:

This function returns no value.

Definition at line 29 of file `cursors.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, `inx_free()`, and `inx_t`.

5.40.1.3 multi_t `inx_cursor_key_active` (`inx_cursor_t * cursor`)

Get the key at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the specified inx cursor.

Definition at line 92 of file `cursors.c`.

References `inx_auto_read()`, `inx_auto_unlock()`, and `mt_get_null()`.

Referenced by `imap_search_messages()`, and `obj_cache_prune()`.

5.40.1.4 multi_t `inx_cursor_key_next` (`inx_cursor_t * cursor`)

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 74 of file cursors.c.

References `inx_auto_read()`, `inx_auto_unlock()`, and `mt_get_null()`.

Referenced by `config_load_cmdline_settings()`, and `config_load_file_settings()`.

5.40.1.5 void inx_cursor_reset (inx_cursor_t * cursor)

Reset the position of an inx cursor.

Parameters:

cursor a pointer to the inx cursor to be reset.

Returns:

This function returns no value.

Definition at line 15 of file cursors.c.

Referenced by `imap_fetch()`, `imap_list()`, `imap_lsub()`, `obj_cache_prune()`, and `portal_smtp_create_data()`.

5.40.1.6 void* inx_cursor_value_active (inx_cursor_t * cursor)

Get the value at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or the value at the current position of the specified inx cursor.

Definition at line 128 of file cursors.c.

References `inx_auto_read()`, and `inx_auto_unlock()`.

Referenced by `config_load_cmdline_settings()`, and `config_load_file_settings()`.

5.40.1.7 void* inx_cursor_value_next (inx_cursor_t * cursor)

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 110 of file cursors.c.

References `inx_auto_read()`, and `inx_auto_unlock()`.

Referenced by `contact_find_detail()`, `contact_find_name()`, `contacts_fetch()`, `contacts_update()`, `http_data_get()`, `imap_append()`, `imap_close()`, `imap_copy()`, `imap_duplicate_messages()`, `imap_examine()`, `imap_expunge()`, `imap_fetch()`, `imap_folder_remove()`, `imap_folder_status()`, `imap_list()`, `imap_lsub()`, `imap_narrow_folders()`, `imap_narrow_messages()`, `imap_next_folder_order()`, `imap_search()`, `imap_search_messages()`, `imap_select()`, `imap_session_destroy()`, `imap_session_update()`, `imap_store()`, `imap_update_flags()`, `magma_folder_children()`, `magma_folder_find_full_name()`, `magma_folder_find_name()`, `messages_update()`, `meta_data_fetch_messages()`, `meta_data_flags_add()`, `meta_data_flags_remove()`, `meta_data_flags_replace()`, `meta_folders_by_name()`, `meta_folders_by_number()`, `meta_folders_children()`, `meta_folders_stats_tags()`, `meta_message_by_number()`, `meta_messages_update_sequences()`, `obj_cache_prune()`, `pattern_check()`, `pop_get_last()`, `pop_get_message()`, `pop_list()`, `pop_session_destroy()`, `pop_session_reset()`, `pop_total_messages()`, `pop_total_size()`, `pop_uidl()`, `portal_config_collection()`, `portal_contact_details()`, `portal_endpoint_alert_list()`, `portal_endpoint_aliases()`, `portal_endpoint_contacts_add()`, `portal_endpoint_contacts_copy()`, `portal_endpoint_contacts_list()`, `portal_endpoint_folders_list()`, `portal_endpoint_folders_tags()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_list()`, `portal_endpoint_messages_tag()`, `portal_endpoint_messages_tags()`, `portal_smtp_create_data()`, `portal_smtp_merge_headers()`, `portal_smtp_relay_message()`, `portal_upload()`, `register_abuse_check_blocklist()`, `signature_tree_get()`, `signature_tree_verify()`, `smtp_bypass_check()`, `smtp_check_filters()`, and `teacher_print_message()`.

5.41.1 Define Documentation

5.41.1.1 #define MAGMA_HASHED_BUCKETS 1024

Definition at line 10 of file hashed.c.

Referenced by [hashed_alloc\(\)](#).

5.41.2 Function Documentation

5.41.2.1 struct __attribute__((packed)) [read]

Definition at line 25 of file hashed.c.

5.41.2.2 inx_t* hashed_alloc (uint64_t options, void * data_free)

Allocate a new hash table. [hashed.c](#)

Parameters:

options an options value for the hash table.

data_free a pointer to a function

Returns:

NULL on failure, or a pointer to the newly allocated hash table object on success.

Definition at line 496 of file hashed.c.

References `hashed_bucket_t`, `hashed_cursor_alloc()`, `hashed_cursor_free()`, `hashed_cursor_key_active()`, `hashed_cursor_key_next()`, `hashed_cursor_reset()`, `hashed_cursor_value_active()`, `hashed_cursor_value_next()`, `hashed_delete()`, `hashed_find()`, `hashed_free()`, `hashed_index_t`, `hashed_insert()`, `hashed_truncate()`, `inx_t`, `MAGMA_HASHED_BUCKETS`, `mm_alloc()`, and `mm_free()`.

Referenced by `inx_alloc()`.

5.41.2.3 uint32_t hashed_bucket (uint32_t buckets, multi_t key)

Get the hash bucket for a key.

Note:

If the key is passed as a string, it will be mapped to a bucket using the Fletcher32 hash.

Parameters:

buckets the total number of buckets for grouping items.

key a multi-type key with the value to be looked up; numbers and strings are supported.

Returns:

the number of the hash bucket corresponding to the specified key.

Definition at line 40 of file hashed.c.

References `bitwise_count()`, `count`, `hash_fletcher32()`, `log_check`, `mt_get_char()`, `mt_get_length()`, `mt_get_number()`, and `mt_is_number()`.

Referenced by `hashed_delete()`, `hashed_find()`, and `hashed_insert()`.

5.41.2.4 void hashed_bucket_add (hashed_bucket_t * bucket, hashed_bucket_t * new)

Definition at line 119 of file hashed.c.

References `hashed_bucket_t`.

Referenced by `hashed_insert()`.

5.41.2.5 hashed_bucket_t* hashed_bucket_alloc (multi_t *key*, void * *data*)

Allocate and initialize hashed bucket object.

Parameters:

key a multi-type key that will be hashed on lookup.

data a pointer to a data buffer associated with the key.

Returns:

NULL on failure, or a pointer to the newly allocated hashed bucket object on success.

Definition at line 70 of file hashed.c.

References hashed_bucket_t, mm_alloc(), and mt_dupe().

Referenced by hashed_insert().

5.41.2.6 void* hashed_bucket_find_key (hashed_bucket_t * *bucket*, multi_t *key*)

Definition at line 173 of file hashed.c.

References data, hashed_bucket_t, and ident_mt_mt().

Referenced by hashed_find().

5.41.2.7 hashed_bucket_t* hashed_bucket_get_ptr (hashed_index_t * *hashed*, uint32_t *num*)

Definition at line 85 of file hashed.c.

References hashed_bucket_t, hashed_index_t, and log_pedantic.

Referenced by hashed_cursor_active(), hashed_delete(), hashed_find(), hashed_free(), hashed_insert(), and hashed_truncate().

5.41.2.8 void hashed_bucket_set_ptr (hashed_index_t * *hashed*, uint32_t *num*, hashed_bucket_t * *bucket*)

Definition at line 103 of file hashed.c.

References hashed_bucket_t, hashed_index_t, and log_pedantic.

Referenced by hashed_delete(), hashed_insert(), and hashed_truncate().

5.41.2.9 hashed_bucket_t* hashed_cursor_active (hashed_cursor_t * *cursor*)

BUG: It's a little unclear what's happening, but when this function gets called, the serials don't match, and the count is greater than the number of available data buckets, because a bucket has been removed, the cursor will get stuck returning the last item endlessly (I think).

Definition at line 274 of file hashed.c.

References count, hashed_bucket_get_ptr(), hashed_bucket_t, and hashed_index_t.

Referenced by hashed_cursor_key_active(), hashed_cursor_next(), and hashed_cursor_value_active().

5.41.2.10 void* hashed_cursor_alloc (inx_t * *inx*)

Definition at line 406 of file hashed.c.

References hashed_cursor_t, log_pedantic, and mm_alloc().

Referenced by hashed_alloc().

5.41.2.11 void hashed_cursor_free (hashed_cursor_t * *cursor*)

Definition at line 397 of file hashed.c.

References mm_free().

Referenced by hashed_alloc().

5.41.2.12 multi_t hashed_cursor_key_active (hashed_cursor_t * *cursor*)

Definition at line 377 of file hashed.c.

References hashed_bucket_t, hashed_cursor_active(), and mt_get_null().

Referenced by hashed_alloc().

5.41.2.13 multi_t hashed_cursor_key_next (hashed_cursor_t * *cursor*)

Definition at line 367 of file hashed.c.

References hashed_bucket_t, hashed_cursor_next(), and mt_get_null().

Referenced by hashed_alloc().

5.41.2.14 hashed_bucket_t* hashed_cursor_next (hashed_cursor_t * *cursor*)

Definition at line 322 of file hashed.c.

References hashed_bucket_t, hashed_cursor_active(), and hashed_index_t.

Referenced by hashed_cursor_key_next(), and hashed_cursor_value_next().

5.41.2.15 void hashed_cursor_reset (hashed_cursor_t * *cursor*)

Definition at line 387 of file hashed.c.

Referenced by hashed_alloc().

5.41.2.16 void* hashed_cursor_value_active (hashed_cursor_t * *cursor*)

Definition at line 357 of file hashed.c.

5.42.1 Define Documentation

5.42.1.1 #define MAGMA_INDEX_OPTION (M_INX_INDEX_LOCK)

The different index options.

Definition at line 32 of file indexes.h.

5.42.1.2 #define MAGMA_INDEX_TYPE (M_INX_TREE | M_INX_LINKED | M_INX_HASHED)

The different types of indexes.

Definition at line 27 of file indexes.h.

Referenced by [inx_alloc\(\)](#).

5.42.2 Enumeration Type Documentation

5.42.2.1 enum MAGMA_INDEX

Index types and options.

Enumerator:

M_INX_TREE M_INX_BTREE.
M_INX_HASHED M_INX_HASHED.
M_INX_LINKED M_INX_LINKED.
M_INX_LOCK_MANUAL M_INX_LOCK_MANUAL.

Definition at line 15 of file indexes.h.

5.42.3 Function Documentation

5.42.3.1 struct __attribute__((packed)) [read]

Definition at line 64 of file indexes.h.

References `inx_t`.

5.42.3.2 inx_t* hashed_alloc (uint64_t options, void * data_free)

[hashed.c](#) [hashed.c](#)

Parameters:

options an options value for the hash table.
data_free a pointer to a function

Returns:

NULL on failure, or a pointer to the newly allocated hash table object on success.

Definition at line 496 of file hashed.c.

References `hashed_bucket_t`, `hashed_cursor_alloc()`, `hashed_cursor_free()`, `hashed_cursor_key_active()`, `hashed_cursor_key_next()`, `hashed_cursor_reset()`, `hashed_cursor_value_active()`, `hashed_cursor_value_next()`, `hashed_delete()`, `hashed_find()`, `hashed_free()`, `hashed_index_t`, `hashed_insert()`, `hashed_truncate()`, `inx_t`, `MAGMA_HASHED_BUCKETS`, `mm_alloc()`, and `mm_free()`.

Referenced by `inx_alloc()`.

5.42.3.3 inx_t* inx_alloc (uint64_t options, void * data_free)

[inx.c](#) [inx.c](#)

Parameters:

options a value indicating the inx type. Can be `M_INX_TREE` for a binary tree, `M_INX_LINKED` for a linked list, or `M_INX_HASHED` for a hash tree.
data_free a function pointer to a routine to free the data associated with an inx record.

Returns:

NULL on failure or a pointer to the newly created inx object on success.

Definition at line 319 of file `inx.c`.

References `hashed_alloc()`, `inx_t`, `linked_alloc()`, `log_options`, `M_INX_HASHED`, `M_INX_LINKED`, `M_INX_LOCK_MANUAL`, `M_INX_TREE`, `M_LOG_ERROR`, `M_LOG_STACK_TRACE`, `MAGMA_INDEX_TYPE`, `rwlock_init()`, and `tree_alloc()`.

5.42.3.4 `bool_t inx_append (inx_t * inx, multi_t key, void * data)`

Append a new record onto an `inx` holder.

Note:

This function only provides benefits for some `inx` types (like linked lists). For other index types, it simply functions as an alias for the `insert` function.

Parameters:

inx a pointer to the `inx` object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 140 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `imap_append_message()`, `imap_duplicate_messages()`, `imap_message_copier()`, `imap_narrow_messages()`, `imap_search_messages()`, `meta_data_fetch_folder_messages()`, and `meta_data_fetch_messages()`.

5.42.3.8 void `inx_cleanup` (`inx_t *inx`)

Perform a checked free of an `inx` object.

See also:

[inx_free\(\)](#)

Parameters:

inx the `inx` instance to be freed.

Definition at line 306 of file `inx.c`.

References `inx_free()`.

Referenced by `contact_free()`, `contacts_update()`, `domain_stop()`, `http_content_stop()`, `http_session_reset()`, `imap_narrow_messages()`, `magma_folder_free()`, `messages_update()`, `meta_data_fetch_folders()`, `meta_data_fetch_mailbox_aliases()`, `meta_free()`, `pattern_stop()`, `pattern_update()`, `sess_destroy()`, `sess_release_composition()`, `smtp_free_inbound()`, and `user_config_free()`.

5.42.3.9 uint64_t `inx_count` (`inx_t *inx`)

Return the total number of items held by an `inx` object.

Parameters:

inx a pointer to the `inx` object to be examined.

Returns:

the total number of items held by the `inx` object.

Definition at line 95 of file `inx.c`.

References `count`, `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

Referenced by `contact_folder_remove()`, `imap_copy()`, `imap_login()`, `imap_narrow_messages()`, `message_folder_remove()`, `obj_cache_prune()`, `pop_pass()`, `signature_tree_add()`, `signature_tree_get()`, and `signature_tree_verify()`.

5.42.3.10 inx_cursor_t* `inx_cursor_alloc` (`inx_t *index`)

[cursors.c](#) [cursors.c](#)

Parameters:

index a pointer to the `inx` object to be traversed.

Returns:

NULL on failure, or a pointer to a new `inx` cursor for the specified `inx` object on success.

Definition at line 52 of file cursors.c.

References `inx_auto_unlock()`, `inx_auto_write()`, and `inx_cursor_t`.

5.42.3.11 void inx_cursor_free (inx_cursor_t * cursor)

Free an inx cursor and the inx object it points to, if the inx reference count hits zero.

Parameters:

cursor the inx cursor to be freed.

Returns:

This function returns no value.

Definition at line 29 of file cursors.c.

References `inx_auto_unlock()`, `inx_auto_write()`, `inx_free()`, and `inx_t`.

Referenced by `config_load_cmdline_settings()`, `config_load_file_settings()`, `contact_find_detail()`, `contact_find_name()`, `contacts_fetch()`, `contacts_update()`, `http_data_get()`, `imap_append()`, `imap_close()`, `imap_copy()`, `imap_duplicate_messages()`, `imap_examine()`, `imap_expunge()`, `imap_fetch()`, `imap_folder_remove()`, `imap_folder_status()`, `imap_list()`, `imap_lsub()`, `imap_narrow_folders()`, `imap_narrow_messages()`, `imap_next_folder_order()`, `imap_search()`, `imap_search_messages()`, `imap_select()`, `imap_session_destroy()`, `imap_session_update()`, `imap_store()`, `imap_update_flags()`, `magma_folder_children()`, `magma_folder_find_full_name()`, `magma_folder_find_name()`, `messages_update()`, `meta_data_fetch_messages()`, `meta_data_flags_add()`, `meta_data_flags_remove()`, `meta_data_flags_replace()`, `meta_folders_by_name()`, `meta_folders_by_number()`, `meta_folders_children()`, `meta_folders_stats_tags()`, `meta_message_by_number()`, `meta_messages_update_sequences()`, `obj_cache_prune()`, `pattern_check()`, `pop_get_last()`, `pop_get_message()`, `pop_list()`, `pop_session_destroy()`, `pop_session_reset()`, `pop_total_messages()`, `pop_total_size()`, `pop_uidl()`, `portal_config_collection()`, `portal_contact_details()`, `portal_endpoint_alert_list()`, `portal_endpoint_aliases()`, `portal_endpoint_contacts_add()`, `portal_endpoint_contacts_copy()`, `portal_endpoint_contacts_list()`, `portal_endpoint_folders_list()`, `portal_endpoint_folders_tags()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_list()`, `portal_endpoint_messages_tag()`, `portal_endpoint_messages_tags()`, `portal_smtp_create_data()`, `portal_smtp_merge_headers()`, `portal_smtp_relay_message()`, `portal_upload()`, `register_abuse_check_blocklist()`, `signature_tree_get()`, `signature_tree_verify()`, `smtp_bypass_check()`, `smtp_check_filters()`, and `teacher_print_message()`.

5.42.3.12 multi_t inx_cursor_key_active (inx_cursor_t * cursor)

Get the key at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the specified inx cursor.

Definition at line 92 of file cursors.c.

References `inx_auto_read()`, `inx_auto_unlock()`, and `mt_get_null()`.

Referenced by `imap_search_messages()`, and `obj_cache_prune()`.

5.42.3.13 `multi_t inx_cursor_key_next (inx_cursor_t * cursor)`

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 74 of file cursors.c.

References `inx_auto_read()`, `inx_auto_unlock()`, and `mt_get_null()`.

Referenced by `config_load_cmdline_settings()`, and `config_load_file_settings()`.

5.42.3.14 `void inx_cursor_reset (inx_cursor_t * cursor)`

Reset the position of an inx cursor.

Parameters:

cursor a pointer to the inx cursor to be reset.

Returns:

This function returns no value.

Definition at line 15 of file cursors.c.

Referenced by `imap_fetch()`, `imap_list()`, `imap_lsub()`, `obj_cache_prune()`, and `portal_smtp_create_data()`.

5.42.3.15 `void* inx_cursor_value_active (inx_cursor_t * cursor)`

Get the value at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or the value at the current position of the specified inx cursor.

Definition at line 128 of file cursors.c.

References `inx_auto_read()`, and `inx_auto_unlock()`.

Referenced by `config_load_cmdline_settings()`, and `config_load_file_settings()`.

5.42.3.16 void* *inx_cursor_value_next* (*inx_cursor_t* * *cursor*)

Get the key at the next *inx* cursor position.

Parameters:

cursor the *inx* cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next *inx* cursor position.

Definition at line 110 of file *cursors.c*.

References *inx_auto_read()*, and *inx_auto_unlock()*.

Referenced by *contact_find_detail()*, *contact_find_name()*, *contacts_fetch()*, *contacts_update()*, *http_data_get()*, *imap_append()*, *imap_close()*, *imap_copy()*, *imap_duplicate_messages()*, *imap_examine()*, *imap_expunge()*, *imap_fetch()*, *imap_folder_remove()*, *imap_folder_status()*, *imap_list()*, *imap_lsub()*, *imap_narrow_folders()*, *imap_narrow_messages()*, *imap_next_folder_order()*, *imap_search()*, *imap_search_messages()*, *imap_select()*, *imap_session_destroy()*, *imap_session_update()*, *imap_store()*, *imap_update_flags()*, *magma_folder_children()*, *magma_folder_find_full_name()*, *magma_folder_find_name()*, *messages_update()*, *meta_data_fetch_messages()*, *meta_data_flags_add()*, *meta_data_flags_remove()*, *meta_data_flags_replace()*, *meta_folders_by_name()*, *meta_folders_by_number()*, *meta_folders_children()*, *meta_folders_stats_tags()*, *meta_message_by_number()*, *meta_messages_update_sequences()*, *obj_cache_prune()*, *pattern_check()*, *pop_get_last()*, *pop_get_message()*, *pop_list()*, *pop_session_destroy()*, *pop_session_reset()*, *pop_total_messages()*, *pop_total_size()*, *pop_uidl()*, *portal_config_collection()*, *portal_contact_details()*, *portal_endpoint_alert_list()*, *portal_endpoint_aliases()*, *portal_endpoint_contacts_add()*, *portal_endpoint_contacts_copy()*, *portal_endpoint_contacts_list()*, *portal_endpoint_folders_list()*, *portal_endpoint_folders_tags()*, *portal_endpoint_messages_flag()*, *portal_endpoint_messages_list()*, *portal_endpoint_messages_tag()*, *portal_endpoint_messages_tags()*, *portal_smtp_create_data()*, *portal_smtp_merge_headers()*, *portal_smtp_relay_message()*, *portal_upload()*, *register_abuse_check_blocklist()*, *signature_tree_get()*, *signature_tree_verify()*, *smtp_bypass_check()*, *smtp_check_filters()*, and *teacher_print_message()*.

5.42.3.17 bool_t *inx_delete* (*inx_t* * *inx*, multi_t *key*)

Delete a child of an *inx* object with a specified key.

Parameters:

inx a pointer to the *inx* object to be searched.

key the target key of the object to be deleted.

Returns:

true if the delete operation succeeded or false if it did not.

Definition at line 218 of file *inx.c*.

References *inx_auto_unlock()*, *inx_auto_write()*, and *log_pedantic*.

Referenced by *contact_edit()*, *contact_folder_remove()*, *contact_move()*, *imap_folder_remove()*, *imap_message_expunge()*, *message_folder_remove()*, *obj_cache_prune()*, *pop_session_destroy()*, *portal_endpoint_attachments_remove()*, *portal_endpoint_contacts_remove()*, *portal_endpoint_messages_remove()*, *portal_endpoint_messages_send()*, *sess_get()*, and *user_config_edit()*.

5.42.3.18 void* *inx_find* (*inx_t* * *inx*, multi_t *key*)

Find the value associated with a particular key within the children of an *inx* object.

Parameters:

inx a pointer to the *inx* object to be searched.

key the target key to be found.

Returns:

NULL on failure, or the value associated with the requested key on success.

Definition at line 242 of file `inx.c`.

References `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

Referenced by `contact_find_detail()`, `contact_find_number()`, `contact_folder_remove()`, `contact_folder_rename()`, `domain_dkim()`, `domain_mailboxes()`, `domain_restricted()`, `domain_spf()`, `domain_wildcard()`, `http_get_static()`, `http_get_template()`, `imap_search_messages()`, `magma_folder_find_number()`, `message_folder_remove()`, `meta_folders_stats_tags()`, `meta_inx_find()`, `meta_inx_remove()`, `meta_messages_mover()`, `portal_endpoint_attachments_add()`, `portal_endpoint_attachments_remove()`, `portal_endpoint_contacts_load()`, `portal_endpoint_messages_compose()`, `portal_endpoint_messages_copy()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_load()`, `portal_endpoint_messages_move()`, `portal_endpoint_messages_remove()`, `portal_endpoint_messages_send()`, `portal_endpoint_messages_tag()`, `portal_get_upload_attachment()`, `sess_get()`, and `user_config_edit()`.

5.42.3.19 void inx_free (inx_t * inx)

Definition at line 260 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, `log_pedantic`, `mm_free()`, and `rwlock_destroy()`.

Referenced by `contacts_update()`, `http_content_refresh()`, `imap_copy()`, `imap_duplicate_messages()`, `imap_fetch()`, `imap_list()`, `imap_lsub()`, `imap_narrow_messages()`, `imap_search()`, `imap_store()`, `inx_cleanup()`, `inx_cursor_free()`, `magma_folder_fetch()`, `messages_update()`, `meta_data_fetch_alerts()`, `meta_data_fetch_all_tags()`, `meta_update_contacts()`, `meta_update_message_folders()`, `nvp_free()`, `obj_cache_stop()`, `portal_endpoint_alert_list()`, `portal_endpoint_folders_tags()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_send()`, `portal_endpoint_messages_tag()`, `portal_endpoint_messages_tags()`, `portal_parse_json_str_array()`, `register_blocklist_free()`, `register_blocklist_update()`, `register_data_fetch_blocklist()`, `signature_tree_free()`, `warehouse_fetch_domains()`, and `warehouse_fetch_patterns()`.

5.42.3.20 bool_t inx_insert (inx_t * inx, multi_t key, void * data)

Insert a new record into an `inx` holder.

Parameters:

inx a pointer to the `inx` object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 165 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `contact_details_fetch()`, `contact_folder_create()`, `contact_move()`, `contacts_fetch()`, `http_content_load_fonts()`, `http_data_value_parse()`, `http_load_file()`, `http_parse_header()`, `imap_folder_create()`, `imap_folder_rename()`, `imap_narrow_folders()`, `magma_folder_fetch()`, `message_folder_create()`, `meta_data_fetch_alerts()`, `meta_data_fetch_all_tags()`, `meta_data_fetch_folders()`, `meta_data_fetch_mailbox_aliases()`, `meta_folders_stats_tags()`, `meta_inx_find()`, `meta_messages_copier()`, `nvp_parse()`, `portal_endpoint_attachments_add()`, `portal_endpoint_contacts_add()`, `portal_endpoint_contacts_copy()`, `portal_endpoint_messages_compose()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_tag()`, `portal_parse_json_str_array()`, `register_data_fetch_blocklist()`, `sess_create()`, `signature_tree_add()`, `smtp_add_bypass_entry()`, `smtp_fetch_inbound()`, `teacher_add_cookie()`, `user_config_fetch()`, `warehouse_fetch_domains()`, and `warehouse_fetch_patterns()`.

5.42.3.21 void inx_lock_read (inx_t * inx)

Acquire a reader's lock for an `inx` object.

Parameters:

inx a pointer to the inx object to be locked.

Returns:

This function returns no value.

Definition at line 34 of file inx.c.

References `rwlock_lock_read()`.

Referenced by `meta_inx_remove()`, `obj_cache_prune()`, and `sess_get()`.

5.42.3.22 void inx_lock_write (inx_t * inx)

Acquire a writer's lock for an inx object.

Parameters:

inx a pointer to the inx object to be locked.

Returns:

This function returns no value.

Definition at line 53 of file inx.c.

References `rwlock_lock_write()`.

Referenced by `meta_inx_find()`, and `obj_cache_prune()`.

5.42.3.23 uint64_t inx_options (inx_t * inx)

Return the options value of an inx object.

Parameters:

inx a pointer to the inx object to be examined.

Returns:

0 on failure, or the options value of the inx object on success.

Definition at line 72 of file inx.c.

References `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

5.42.3.24 bool_t inx_replace (inx_t * inx, multi_t key, void * data)

Replace the value of a key in an inx holder.

Parameters:

inx a pointer to the inx object where the specified key will be replaced.

key a multi-type value specifying the identifier of the record to be replaced.

data a pointer to the new data to be associated with the specified key.

Returns:

true if the specified key's value was replaced successfully, or false on failure.

Definition at line 190 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `contact_edit()`, and `user_config_edit()`.

5.42.3.25 `uint64_t inx_serial (inx_t * inx)`

Definition at line 113 of file `inx.c`.

References `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

5.42.3.26 `void inx_truncate (inx_t * inx)`

Definition at line 285 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `meta_data_fetch_messages()`, and `user_config_update()`.

5.42.3.27 `void inx_unlock (inx_t * inx)`

Unlock an `inx` object.

Parameters:

inx a pointer to the `inx` object to be unlocked.

Returns:

This function returns no value.

Definition at line 15 of file `inx.c`.

References `rwlock_unlock()`.

Referenced by `meta_inx_find()`, `meta_inx_remove()`, `obj_cache_prune()`, and `sess_get()`.

5.42.3.28 `inx_t* linked_alloc (uint64_t options, void * data_free)`

[linked.c](#) [linked.c](#)

Parameters:

options an options value for the newly created linked list object.

data_free a pointer to a function used to free linked list items.

Returns:

NULL on failure or a pointer to the newly allocated linked list object on success.

Definition at line 531 of file `linked.c`.

Allocate a new inx instance.

5.43.1 Function Documentation

5.43.1.1 `inx_t* inx_alloc (uint64_t options, void * data_free)`

Allocate a new inx instance. [inx.c](#)

Parameters:

options a value indicating the inx type. Can be M_INX_TREE for a binary tree, M_INX_LINKED for a linked list, or M_INX_HASHED for a hash tree.

data_free a function pointer to a routine to free the data associated with an inx record.

Returns:

NULL on failure or a pointer to the newly created inx object on success.

Definition at line 319 of file inx.c.

References `hashed_alloc()`, `inx_t`, `linked_alloc()`, `log_options`, `M_INX_HASHED`, `M_INX_LINKED`, `M_INX_LOCK_MANUAL`, `M_INX_TREE`, `M_LOG_ERROR`, `M_LOG_STACK_TRACE`, `MAGMA_INDEX_TYPE`, `rwlock_init()`, and `tree_alloc()`.

5.43.1.2 `bool_t inx_append (inx_t * inx, multi_t key, void * data)`

Append a new record onto an inx holder.

Note:

This function only provides benefits for some inx types (like linked lists). For other index types, it simply functions as an alias for the insert function.

Parameters:

inx a pointer to the inx object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 140 of file inx.c.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `imap_append_message()`, `imap_duplicate_messages()`, `imap_message_copier()`, `imap_narrow_messages()`, `imap_search_messages()`, `meta_data_fetch_folder_messages()`, and `meta_data_fetch_messages()`.

5.43.1.3 `void inx_auto_read (inx_t * inx)`

Definition at line 41 of file inx.c.

5.43.1.6 void `inx_cleanup` (`inx_t *inx`)

Perform a checked free of an `inx` object.

See also:

[`inx_free\(\)`](#)

Parameters:

inx the `inx` instance to be freed.

Definition at line 306 of file `inx.c`.

References `inx_free()`.

Referenced by `contact_free()`, `contacts_update()`, `domain_stop()`, `http_content_stop()`, `http_session_reset()`, `imap_narrow_messages()`, `magma_folder_free()`, `messages_update()`, `meta_data_fetch_folders()`, `meta_data_fetch_mailbox_aliases()`, `meta_free()`, `pattern_stop()`, `pattern_update()`, `sess_destroy()`, `sess_release_composition()`, `smtp_free_inbound()`, and `user_config_free()`.

5.43.1.7 uint64_t `inx_count` (`inx_t *inx`)

Return the total number of items held by an `inx` object.

Parameters:

inx a pointer to the `inx` object to be examined.

Returns:

the total number of items held by the `inx` object.

Definition at line 95 of file `inx.c`.

References `count`, `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

Referenced by `contact_folder_remove()`, `imap_copy()`, `imap_login()`, `imap_narrow_messages()`, `message_folder_remove()`, `obj_cache_prune()`, `pop_pass()`, `signature_tree_add()`, `signature_tree_get()`, and `signature_tree_verify()`.

5.43.1.8 bool_t `inx_delete` (`inx_t *inx`, `multi_t key`)

Delete a child of an `inx` object with a specified key.

Parameters:

inx a pointer to the inx object to be searched.

key the target key of the object to be deleted.

Returns:

true if the delete operation succeeded or false if it did not.

Definition at line 218 of file inx.c.

References inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_edit(), contact_folder_remove(), contact_move(), imap_folder_remove(), imap_message_expunge(), message_folder_remove(), obj_cache_prune(), pop_session_destroy(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_remove(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), sess_get(), and user_config_edit().

5.43.1.9 void* inx_find (inx_t * inx, multi_t key)

Find the value associated with a particular key within the children of an inx object.

Parameters:

inx a pointer to the inx object to be searched.

key the target key to be found.

Returns:

NULL on failure, or the value associated with the requested key on success.

Definition at line 242 of file inx.c.

References inx_auto_read(), inx_auto_unlock(), and log_pedantic.

Referenced by contact_find_detail(), contact_find_number(), contact_folder_remove(), contact_folder_rename(), domain_dkim(), domain_mailboxes(), domain_restricted(), domain_spf(), domain_wildcard(), http_get_static(), http_get_template(), imap_search_messages(), magma_folder_find_number(), message_folder_remove(), meta_folders_stats_tags(), meta_inx_find(), meta_inx_remove(), meta_messages_mover(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_load(), portal_endpoint_messages_compose(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_load(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), portal_endpoint_messages_tag(), portal_get_upload_attachment(), sess_get(), and user_config_edit().

5.43.1.10 void inx_free (inx_t * inx)

Definition at line 260 of file inx.c.

References inx_auto_unlock(), inx_auto_write(), log_pedantic, mm_free(), and rwlock_destroy().

Referenced by contacts_update(), http_content_refresh(), imap_copy(), imap_duplicate_messages(), imap_fetch(), imap_list(), imap_lsub(), imap_narrow_messages(), imap_search(), imap_store(), inx_cleanup(), inx_cursor_free(), magma_folder_fetch(), messages_update(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_update_contacts(), meta_update_message_folders(), nvp_free(), obj_cache_stop(), portal_endpoint_alert_list(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_send(), portal_endpoint_messages_tag(), portal_endpoint_messages_tags(), portal_parse_json_str_array(), register_blocklist_free(), register_blocklist_update(), register_data_fetch_blocklist(), signature_tree_free(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.43.1.11 bool_t inx_insert (inx_t * inx, multi_t key, void * data)

Insert a new record into an inx holder.

Parameters:

- inx* a pointer to the inx object that will hold the record.
- key* a multi-type value specifying the identifier of the record to be inserted.
- data* a pointer to the data associated with the new key.

Returns:

- true if the new record was inserted successfully or false on failure.

Definition at line 165 of file inx.c.

References inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_details_fetch(), contact_folder_create(), contact_move(), contacts_fetch(), http_content_load_fonts(), http_data_value_parse(), http_load_file(), http_parse_header(), imap_folder_create(), imap_folder_rename(), imap_narrow_folders(), magma_folder_fetch(), message_folder_create(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_folders_stats_tags(), meta_inx_find(), meta_messages_copier(), nvp_parse(), portal_endpoint_attachments_add(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_messages_compose(), portal_endpoint_messages_flag(), portal_endpoint_messages_tag(), portal_parse_json_str_array(), register_data_fetch_blocklist(), sess_create(), signature_tree_add(), smtp_add_bypass_entry(), smtp_fetch_inbound(), teacher_add_cookie(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.43.1.12 void inx_lock_read (inx_t * inx)

Acquire a reader's lock for an inx object.

Parameters:

- inx* a pointer to the inx object to be locked.

Returns:

- This function returns no value.

Definition at line 34 of file inx.c.

References rwlock_lock_read().

Referenced by meta_inx_remove(), obj_cache_prune(), and sess_get().

5.43.1.13 void inx_lock_write (inx_t * inx)

Acquire a writer's lock for an inx object.

Parameters:

- inx* a pointer to the inx object to be locked.

Returns:

- This function returns no value.

Definition at line 53 of file inx.c.

References rwlock_lock_write().

Referenced by meta_inx_find(), and obj_cache_prune().

5.43.1.14 uint64_t `inx_options` (`inx_t *inx`)

Return the options value of an `inx` object.

Parameters:

inx a pointer to the `inx` object to be examined.

Returns:

0 on failure, or the options value of the `inx` object on success.

Definition at line 72 of file `inx.c`.

References `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

5.43.1.15 bool_t `inx_replace` (`inx_t *inx`, `multi_t key`, `void *data`)

Replace the value of a key in an `inx` holder.

Parameters:

inx a pointer to the `inx` object where the specified key will be replaced.

key a multi-type value specifying the identifier of the record to be replaced.

data a pointer to the new data to be associated with the specified key.

Returns:

true if the specified key's value was replaced successfully, or false on failure.

Definition at line 190 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `contact_edit()`, and `user_config_edit()`.

5.43.1.16 uint64_t `inx_serial` (`inx_t *inx`)

Definition at line 113 of file `inx.c`.

References `inx_auto_read()`, `inx_auto_unlock()`, and `log_pedantic`.

5.43.1.17 void `inx_truncate` (`inx_t *inx`)

Definition at line 285 of file `inx.c`.

References `inx_auto_unlock()`, `inx_auto_write()`, and `log_pedantic`.

Referenced by `meta_data_fetch_messages()`, and `user_config_update()`.

5.43.1.18 void `inx_unlock` (`inx_t *inx`)

Unlock an `inx` object.

Parameters:

inx a pointer to the `inx` object to be unlocked.

Returns:

This function returns no value.

Definition at line 15 of file `inx.c`.

References `rwlock_unlock()`.

Referenced by `meta_inx_find()`, `meta_inx_remove()`, `obj_cache_prune()`, and `sess_get()`.

```
#include "magma.h"
```

Functions

- struct `__attribute__((packed))`
- void * `linked_record_get_data` (`linked_record_t` *record, size_t element)
Get the data associated with a linked list record.
- multi_t `linked_record_get_key` (`linked_record_t` *record)
Get the multi-type key of a linked list record.
- void `linked_record_free` (`inx_t` *index, `linked_record_t` *record)
Free a linked list record object and its underlying data.
- `linked_record_t` * `linked_record_alloc` (`multi_t` key, void *data)
Create a new linked list record object.
- void * `linked_find` (void *inx, `multi_t` key)
Find a record in a linked list by key.
- `bool_t` `linked_delete` (void *inx, `multi_t` key)
Remove a record from a linked list and free it and its underlying data.
- `bool_t` `linked_insert` (void *inx, `multi_t` key, void *data)
Create and append a new record to the end of a linked list.
- `bool_t` `linked_append` (void *inx, `multi_t` key, void *data)
Create and append a new record to the end of a linked list.
- `linked_node_t` * `linked_cursor_active` (`linked_cursor_t` *cursor)
Get the current node pointed to by a linked list cursor.
- `linked_node_t` * `linked_cursor_next` (`linked_cursor_t` *cursor)
Get the next node of a linked list cursor.
- void * `linked_cursor_value_next` (`linked_cursor_t` *cursor)
Get the data of a linked list cursor's next record, and update the cursor.
- void * `linked_cursor_value_active` (`linked_cursor_t` *cursor)
Get the data of a linked list cursor's current record.
- `multi_t` `linked_cursor_key_next` (`linked_cursor_t` *cursor)
Get the multi-type key value of a linked list cursor's next record, and update the cursor.
- `multi_t` `linked_cursor_key_active` (`linked_cursor_t` *cursor)
Get the multi-type key value at the current linked list cursor position.
- void `linked_cursor_reset` (`linked_cursor_t` *cursor)
Reset the position of a linked list cursor.

- void [linked_cursor_free](#) ([linked_cursor_t](#) *cursor)
Free a linked list cursor.
- void * [linked_cursor_alloc](#) ([inx_t](#) *inx)
Allocate a cursor to traverse a linked list.
- void [linked_truncate](#) (void *inx)
Truncate all the nodes in a linked list, but do not free it.
- void [linked_free](#) (void *inx)
Free a linked list object and all of its records.
- [inx_t](#) * [linked_alloc](#) (uint64_t options, void *data_free)
Allocate a new linked list instance.

Variables

- [linked_record_t](#)

- [linked_cursor_t](#)

5.44.1 Function Documentation

5.44.1.1 struct __attribute__((packed)) [read]

Definition at line 22 of file [linked.c](#).

References [count](#), [inx_t](#), and [linked_node_t](#).

5.44.1.2 inx_t* linked_alloc (uint64_t options, void * data_free)

Allocate a new linked list instance. [linked.c](#)

Parameters:

options an options value for the newly created linked list object.

data_free a pointer to a function used to free linked list items.

Returns:

NULL on failure or a pointer to the newly allocated linked list object on success.

Definition at line 531 of file [linked.c](#).

References [inx_t](#), [linked_append\(\)](#), [linked_cursor_alloc\(\)](#), [linked_cursor_free\(\)](#), [linked_cursor_key_active\(\)](#), [linked_cursor_key_next\(\)](#), [linked_cursor_reset\(\)](#), [linked_cursor_value_active\(\)](#), [linked_cursor_value_next\(\)](#), [linked_delete\(\)](#), [linked_find\(\)](#), [linked_free\(\)](#), [linked_insert\(\)](#), [linked_truncate\(\)](#), and [mm_alloc\(\)](#).

Referenced by [inx_alloc\(\)](#).

5.44.1.3 `bool_t linked_append(void * inx, multi_t key, void * data)`

Create and append a new record to the end of a linked list.

Note:

This function depends on the *inx* layer to track the list ending via the last variable.

Parameters:

inx a pointer to the linked list that will store the new record.

key a multi-type key value that will be associated with the newly created record.

data a pointer to the data that will be associated with the new record.

Returns:

true on success or false on failure.

Definition at line 244 of file linked.c.

References `inx_t`, `linked_node_t`, `linked_record_alloc()`, `log_info`, `log_pedantic`, `mm_alloc()`, and `mm_free()`.

Referenced by `linked_alloc()`.

5.44.1.4 `linked_node_t* linked_cursor_active(linked_cursor_t * cursor)`

Get the current node pointed to by a linked list cursor.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

a pointer to the current node indicated by the specified linked list cursor.

LOW: The logic used to find our place in an index that has been modified could be improved.

- If the index we sort the index keys, we could look for the next highest key value.
- We could store the previous node (or even the previous 10 nodes), and try searching for them instead.
- We could also add a delete path through the cursor that would include positional updates.
- We could simply make a deep copy of the entire list so that updates to the original index don't affect the iteration, or use the copy to reconcile.

Definition at line 291 of file linked.c.

References `linked_node_t`.

Referenced by `linked_cursor_key_active()`, `linked_cursor_next()`, and `linked_cursor_value_active()`.

5.44.1.5 `void* linked_cursor_alloc(inx_t * inx)`

Allocate a cursor to traverse a linked list.

Parameters:

inx a pointer the linked list object to be traversed by the cursor.

Returns:

NULL on failure, or a cursor pointing to the head of the linked list on success.

Definition at line 461 of file linked.c.

References linked_cursor_t, log_pedantic, and mm_alloc().

Referenced by linked_alloc().

5.44.1.6 void linked_cursor_free (linked_cursor_t * *cursor*)

Free a linked list cursor.

Parameters:

cursor a pointer to the linked list cursor object to be freed.

Returns:

This function returns no value.

Definition at line 447 of file linked.c.

References mm_free().

Referenced by linked_alloc().

5.44.1.7 multi_t linked_cursor_key_active (linked_cursor_t * *cursor*)

Get the multi-type key value at the current linked list cursor position.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

an empty multi-type key on failure, or the current linked list cursor's record key on success.

Definition at line 416 of file linked.c.

References linked_cursor_active(), linked_node_t, linked_record_get_key(), and mt_get_null().

Referenced by linked_alloc().

5.44.1.8 multi_t linked_cursor_key_next (linked_cursor_t * *cursor*)

Get the multi-type key value of a linked list cursor's next record, and update the cursor.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

an empty multi-type key on failure, or the linked list cursor's next record key on success.

Definition at line 400 of file linked.c.

References linked_cursor_next(), linked_node_t, linked_record_get_key(), and mt_get_null().

Referenced by linked_alloc().

5.44.1.9 linked_node_t* linked_cursor_next (linked_cursor_t * cursor)

Get the next node of a linked list cursor.

Note:

The cursor position will be reset if the end of the linked list has been reached.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

a pointer to the next node of the linked list cursor.

Definition at line 348 of file linked.c.

References `linked_cursor_active()`, and `linked_node_t`.

Referenced by `linked_cursor_key_next()`, and `linked_cursor_value_next()`.

5.44.1.10 void linked_cursor_reset (linked_cursor_t * cursor)

Reset the position of a linked list cursor.

Parameters:

cursor a pointer to the linked list cursor object to be reset.

Returns:

This function returns no value.

Definition at line 432 of file linked.c.

Referenced by `linked_alloc()`.

5.44.1.11 void* linked_cursor_value_active (linked_cursor_t * cursor)

Get the data of a linked list cursor's current record.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

NULL on failure, or a pointer to the data of the linked list cursor's current record.

Definition at line 385 of file linked.c.

References `linked_cursor_active()`, `linked_node_t`, and `linked_record_get_data()`.

Referenced by `linked_alloc()`.

5.44.1.12 void* linked_cursor_value_next (linked_cursor_t * cursor)

Get the data of a linked list cursor's next record, and update the cursor.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

NULL on failure, or the data of the linked list cursor's next record on success.

Definition at line 370 of file linked.c.

References `linked_cursor_next()`, `linked_node_t`, and `linked_record_get_data()`.

Referenced by `linked_alloc()`.

5.44.1.13 bool_t linked_delete (void * *inx*, multi_t *key*)

Remove a record from a linked list and free it and its underlying data.

Parameters:

inx a pointer to the linked list to be searched for the specified key.

key a multi-type key value to lookup the record that will be deleted from the linked list.

Returns:

true on success or false on failure.

Definition at line 136 of file linked.c.

References `ident_mt_mt()`, `inx_t`, `linked_node_t`, `linked_record_free()`, and `mm_free()`.

Referenced by `linked_alloc()`.

5.44.1.14 void* linked_find (void * *inx*, multi_t *key*)

Find a record in a linked list by key.

Parameters:

inx a pointer to the linked list to be searched.

key a multi-type key value to be searched against the contents of the `inx` object.

Returns:

NULL on failure or if the record cannot be found, or a pointer to the data of the matching record on success.

Definition at line 107 of file linked.c.

References `ident_mt_mt()`, `inx_t`, `linked_node_t`, and `linked_record_get_data()`.

Referenced by `linked_alloc()`.

5.44.1.15 void linked_free (void * *inx*)

Free a linked list object and all of its records.

See also:

[linked_truncate\(\)](#)

Parameters:

inx a pointer to the linked list object to be freed.

Returns:

This function returns no value.

Definition at line 511 of file linked.c.

References `inx_t`, and `linked_truncate()`.

Referenced by `linked_alloc()`.

5.44.1.16 bool_t linked_insert (void * *inx*, multi_t *key*, void * *data*)

Create and append a new record to the end of a linked list.

Note:

note In the future this should be updated so the key value is used to insert the record in the correct spot.

Parameters:

inx a pointer to the linked list that will store the new record.

key a multi-type key value that will be associated with the newly created record.

data a pointer to the data that will be associated with the new record.

Returns:

true on success or false on failure.

TODO: We are simply looking for the end. The append variation handles this use case. Insert should be using the key value to find the appropriate place to insert the record.

TODO: When the logic is altered to do a comparison, and insert nodes in the proper place this assignment will need to become a conditional.

Definition at line 192 of file linked.c.

References `inx_t`, `linked_node_t`, `linked_record_alloc()`, `log_info`, `mm_alloc()`, and `mm_free()`.

Referenced by `linked_alloc()`.

5.44.1.17 linked_record_t* linked_record_alloc (multi_t *key*, void * *data*)

Create a new linked list record object.

Parameters:

key the multi-type key value of the record to be used for data searches.

data a pointer to the data to be associated with the record.

Returns:

a pointer to the newly allocated and initialized linked record object.

Definition at line 88 of file linked.c.

References `linked_record_t`, `mm_alloc()`, and `mt_dupe()`.

Referenced by `linked_append()`, and `linked_insert()`.

5.44.1.18 void linked_record_free (inx_t * *index*, linked_record_t * *record*)

Free a linked list record object and its underlying data.

Parameters:

index a pointer to the linked list containing the specified record.

record a pointer to the linked list record to be freed.

Returns:

This function returns no value.

Definition at line 67 of file linked.c.

References log_pedantic, mm_free(), and mt_free().

Referenced by linked_delete(), and linked_truncate().

5.44.1.19 void* linked_record_get_data (linked_record_t * *record*, size_t *element*)

Get the data associated with a linked list record.

Parameters:

record a pointer to the linked list record to be queried.

element the index of the data element to be retrieved. Must be set to zero.

Returns:

NULL on failure, or a pointer to the specified linked list record's data on success.

Definition at line 34 of file linked.c.

References log_pedantic.

Referenced by linked_cursor_value_active(), linked_cursor_value_next(), and linked_find().

5.44.1.20 multi_t linked_record_get_key (linked_record_t * *record*)

Get the multi-type key of a linked list record.

Parameters:

record a pointer to the linked list record to be queried.

Returns:

an empty multi-type key on failure, or the specified record's multi-type key value on success.

Definition at line 49 of file linked.c.

References log_pedantic, and mt_get_null().

Referenced by linked_cursor_key_active(), and linked_cursor_key_next().

5.44.1.21 void linked_truncate (void * *inx*)

Truncate all the nodes in a linked list, but do not free it.

Parameters:

inx a pointer to the linked list object to have all of its records truncated.

Returns:

This function returns no value.

Definition at line 480 of file linked.c.

References `inx_t`, `linked_node_t`, `linked_record_free()`, and `mm_free()`.

Referenced by `linked_alloc()`, and `linked_free()`.

Functions

- [uint_t bitwise_count](#) (uint64_t value)
Count the number of bits that are set in a 64-bit number.
- [uchar_t bitwise_or](#) (uchar_t a, uchar_t b)
Performs a bitwise OR operation on two octets and returns the result as a single octet.
- [uchar_t bitwise_xor](#) (uchar_t a, uchar_t b)
Performs a bitwise XOR operation on two octets and returns the result as a single octet.
- [uchar_t bitwise_and](#) (uchar_t a, uchar_t b)
Performs a bitwise AND operation on two octets and returns the result as a single octet.

5.46.1 Function Documentation

5.46.1.1 uchar_t bitwise_and (uchar_t a, uchar_t b) [inline]

Performs a bitwise AND operation on two octets and returns the result as a single octet.

Definition at line 44 of file bitwise.c.

Referenced by st_and().

5.46.1.2 uint_t bitwise_count (uint64_t value)

Count the number of bits that are set in a 64-bit number. bitwise.c

Parameters:

value an unsigned 64-bit value to be checked.

Returns:

the number of bits in value that are set.

Definition at line 15 of file bitwise.c.

Referenced by hashed_bucket(), slots_count(), and st_valid_opts().

5.46.1.3 uchar_t bitwise_or (uchar_t a, uchar_t b) [inline]

Performs a bitwise OR operation on two octets and returns the result as a single octet.

Definition at line 30 of file bitwise.c.

Referenced by st_or().

5.46.1.4 `uchar_t bitwise_xor(uchar_t a, uchar_t b)` `[inline]`

Performs a bitwise XOR operation on two octets and returns the result as a single octet.

Definition at line 37 of file bitwise.c.

Referenced by `st_xor()`.

5.47 src/core/parsers/bitwise.c File Reference

#include "magma.h"
```

Functions

- `stringer_t * st_bitwise (stringer_t *a, stringer_t *b, stringer_t *output, uchr_t(*bitwise)(uchr_t, uchr_t))`
Perform bitwise operation on two input strings.
- `stringer_t * st_not (stringer_t *s, stringer_t *output)`
Perform bitwise NOT operation on a managed string.
- `stringer_t * st_or (stringer_t *a, stringer_t *b, stringer_t *output)`
Perform bitwise OR operation between two input strings.
- `stringer_t * st_xor (stringer_t *a, stringer_t *b, stringer_t *output)`
Perform bitwise XOR operation between two input strings.
- `stringer_t * st_and (stringer_t *a, stringer_t *b, stringer_t *output)`
Perform bitwise AND operation between two input strings.

5.47.1 Function Documentation

5.47.1.1 `stringer_t* st_and (stringer_t * a, stringer_t * b, stringer_t * output)`

Perform bitwise AND operation between two input strings.

Parameters:

- a*** First stringer input.
- b*** Second stringer input.
- output*** Stringer in which the result is stored, if no stringer is provided (`output = NULL`) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 149 of file bitwise.c.

References `bitwise_and()`, and `st_bitwise()`.

5.47.1.2 `stringer_t* st_bitwise (stringer_t * a, stringer_t * b, stringer_t * output, uchr_t(*) (uchr_t, uchr_t) bitwise)`

Perform bitwise operation on two input strings.

Note:

Function pointers are used to determine which bitwise operation is performed. This isn't very efficient, because even though the functions are marked as inline, they aren't actually being inlined by the compiler... but keeping it this way does make it easier to read. If profiling reveals a performance problem, the functions can be moved to the header file, and thus inlined, replaced with a macro, or even a switch statement that keys off an enumerated variable.

Parameters:

- a* First stringer input.
- b* Second stringer input.
- output** Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.
- bitwise** A function pointer to the bitwise operation.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 24 of file bitwise.c.

References data, log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), and st_valid_destination().

Referenced by st_and(), st_or(), and st_xor().

5.47.1.3 stringer_t* st_not (stringer_t * s, stringer_t * output)

Perform bitwise NOT operation on a managed string.

Parameters:

- s* Stringer input.
- output** Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 75 of file bitwise.c.

References data, log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), and st_valid_destination().

5.47.1.4 stringer_t* st_or (stringer_t * a, stringer_t * b, stringer_t * output)

Perform bitwise OR operation between two input strings.

Parameters:

- a* First stringer input.
- b* Second stringer input.
- output** Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 123 of file bitwise.c.

References bitwise_or(), and st_bitwise().

5.47.1.5 `stringer_t* st_xor (stringer_t * a, stringer_t * b, stringer_t * output)`

Perform bitwise XOR operation between two input strings. bitwise.c

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (`output = NULL`) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, `NULL` on error.

Definition at line 136 of file bitwise.c.

References `bitwise_xor()`, and `st_bitwise()`.

Referenced by `aes_artifact_decrypt()`, `aes_artifact_encrypt()`, `aes_chunk_decrypt()`, `aes_chunk_encrypt()`, `signature_full_get()`, `signature_full_verify()`, `signature_tree_get()`, `signature_tree_verify()`, `slots_key()`, `slots_set()`, `stacie_decrypt()`, `stacie_encrypt()`, and `stacie_realm_key()`.

5.48 src/core/memory/memory.c File Reference

```
#include "magma.h"
```

Functions

- void [mm_cleanup_variadic](#) (ssize_t len,...)
A checked cleanup function which can be used free a variable number memory buffers.
- [bool_t mm_empty](#) (void *block, size_t len)
Determine whether the memory buffer and/or its length encompass an empty block.
- void * [mm_copy](#) (void *dst, const void *src, size_t len)
Copy data from one buffer to another.
- void * [mm_move](#) (void *dst, void *src, size_t len)
Copy the contents of one buffer into another one, allowing for overlapping data.
- void * [mm_set](#) (void *block, uint8_t set, size_t len)
Sets a block of memory to a specified value.
- void * [mm_wipe](#) (void *block, size_t len)
Zero out a block of memory.
- void [mm_free](#) (void *block)
Free a block of memory.
- void * [mm_dupe](#) (void *block, size_t len)
Duplicate a block of memory.
- void * [mm_alloc](#) (size_t len)
Allocate a chunk of memory with the system allocator and zero-wipe it.

5.48.1 Function Documentation

5.48.1.1 void* mm_alloc (size_t len)

Allocate a chunk of memory with the system allocator and zero-wipe it. [memory.c](#)

Note:

Uses the 'malloc' function attribute to indicate any non-NULL return value is not an alias for any other valid pointer. The buffer length must be non-zero.

See also:

<http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html>

Parameters:

len the amount of memory to allocate.

Returns:

a valid pointer to the allocated memory on success, or NULL on error.

Definition at line 182 of file memory.c.

References `log_pedantic`, and `mm_set()`.

Referenced by `_serialize_ec_privkey()`, `_serialize_ec_pubkey()`, `alert_alloc()`, `alias_alloc()`, `auth_alloc()`, `auth_legacy_alloc()`, `auth_stacie_alloc()`, `cache_alloc()`, `client_connect()`, `compress_alloc()`, `compress_lzo()`, `con_init()`, `con_print()`, `contact_alloc()`, `contact_detail_alloc()`, `cryptex_alloc()`, `deprecated_cryptex_alloc()`, `deprecated_ecies_decrypt()`, `deprecated_ecies_key_public_bin()`, `deprecated_scramble_alloc()`, `dkim_memory_alloc()`, `domain_alloc()`, `ecies_decrypt()`, `ecies_key_public_bin()`, `ed25519_alloc()`, `encrypted_chunk_alloc()`, `encrypted_message_alloc()`, `ephemeral_chunk_alloc()`, `hashed_alloc()`, `hashed_bucket_alloc()`, `hashed_cursor_alloc()`, `http_data_header_parse_line()`, `http_data_value_parse()`, `http_load_file()`, `http_page_get()`, `imap_append_message()`, `imap_copy()`, `imap_fetch_response_add()`, `imap_folder_create()`, `imap_folder_rename()`, `imap_parse_dataitems()`, `keys_alloc()`, `linked_alloc()`, `linked_append()`, `linked_cursor_alloc()`, `linked_insert()`, `linked_record_alloc()`, `magma_folder_alloc()`, `mail_cache_set()`, `mail_create_message()`, `mail_message()`, `mail_mime_part()`, `message_alloc()`, `meta_alloc()`, `meta_data_fetch_folders()`, `meta_data_fetch_messages()`, `meta_folder_stats_tag_alloc()`, `mm_dupe()`, `ns_alloc()`, `ns_dupe()`, `ns_import()`, `nvp_alloc()`, `org_key_alloc()`, `org_key_generate()`, `org_signet_alloc()`, `org_signet_generate()`, `pool_alloc()`, `portal_endpoint_attachments_add()`, `portal_endpoint_messages_compose()`, `prime_alloc()`, `prime_object_alloc()`, `process_start()`, `queue_init()`, `register_session_generate()`, `register_session_get()`, `relay_alloc()`, `requeue()`, `res_bind_create()`, `res_row_store()`, `res_table_alloc()`, `scramble_alloc()`, `servers_alloc()`, `sess_create()`, `signature_tree_alloc()`, `slots_alloc()`, `smtp_add_bypass_entry()`, `smtp_add_recipient()`, `smtp_fetch_authorization()`, `smtp_fetch_inbound()`, `ssl_start()`, `st_alloc_opts()`, `st_realloc()`, `stacker_alloc()`, `stacker_push()`, `stmt_start()`, `system_init_impersonation()`, `tank_start()`, `tank_store()`, `tcp_addr_ip()`, `teacher_data_fetch()`, `teacher_data_get()`, `thread_alloc()`, `tls_print()`, `tree_alloc()`, `tree_cursor_alloc()`, `user_config_alloc()`, `user_config_entry_alloc()`, `user_key_alloc()`, `user_key_generate()`, `user_request_generate()`, `user_request_rotation()`, `user_request_sign()`, and `user_signet_alloc()`.

5.48.1.2 void mm_cleanup_variadic (ssize_t len, ...)

A checked cleanup function which can be used free a variable number memory buffers.

See also:

[mm_free](#)

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 18 of file memory.c.

References `mm_free()`.

5.48.1.3 void* mm_copy (void *dst, const void *src, size_t len)

Copy data from one buffer to another.

Note:

For overlapping data regions, `bl_move()` must be used.

Warning:

This function performs an aligned copy so data directly after the `src` buffer may end up inside the `dst` buffer.

Parameters:

dst the destination buffer of the copy operation.

src the source buffer of the copy operation.

len the length, in bytes, of the data to be copied.

Returns:

a pointer to the destination buffer.

Definition at line 59 of file memory.c.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), alert_alloc(), alias_alloc(), chunk_buffer_size(), chunk_header_size(), chunk_header_write(), client_connect(), contact_alloc(), contact_detail_alloc(), deprecated_scramble_encrypt(), deserialize_ns(), deserialize_st(), domain_alloc(), ed25519_generate(), ed25519_private_get(), ed25519_private_set(), ed25519_public_get(), ed25519_public_set(), encrypted_chunk_get(), encrypted_chunk_set(), imap_folder_create(), imap_folder_rename(), imap_parse_literal(), ip_copy(), magma_folder_alloc(), message_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), mm_sec_realloc(), naked_message_set(), net_trigger(), ns_append(), ns_dupe(), ns_import(), prime_field_write(), prime_header_read(), prime_header_write(), prime_reader_size(), res_row_store(), scramble_encrypt(), serialize_ns(), serialize_st(), smtp_auth_plain(), st_append_opts(), st_append_out(), st_copy_in(), st_dupe_opts(), st_import_opts(), st_merge_opts(), st_nullify(), st_realloc(), st_write_variadic(), tank_load(), tank_store(), tcp_addr_ip(), tree_cursor_next(), tree_delete(), and user_config_entry_alloc().

5.48.1.4 void* mm_dupe (void * *block*, size_t *len*)

Duplicate a block of memory.

Parameters:

block a pointer to the block of memory to be duplicated.

len the length, in bytes, of the buffer to be duplicated.

Returns:

a freshly allocated buffer containing a copy of the input data.

Definition at line 153 of file memory.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by contact_name(), imap_command_log_safe(), imap_narrow_folders(), and meta_message_dupe().

5.48.1.5 bool_t mm_empty (void * *block*, size_t *len*)

Determine whether the memory buffer and/or its length encompass an empty block.

Parameters:

block a pointer to the block of memory to be assessed.

len the length, in bytes, of the memory block.

Returns:

false if block is NULL or len is 0; true otherwise.

Definition at line 41 of file memory.c.

Referenced by line_pl_bl(), mm_cmp_ci_eq(), mm_cmp_cs_eq(), str_tok_get_bl(), str_tok_get_count_bl(), tok_get_count_bl(), and tok_get_ns().

5.48.1.6 void mm_free (void * *block*)

Free a block of memory.

Note:

block can point to either a secure or insecure memory block.

Parameters:

block a pointer to the block to be freed.

Returns:

This function does not return any value.

Definition at line 129 of file memory.c.

References `log_pedantic`, and `mm_sec_secured()`.

5.48.1.7 void* mm_move (void *dst, void *src, size_t len)

Copy the contents of one buffer into another one, allowing for overlapping data.

See also:

`memmove()`

Parameters:

dst a pointer to the destination buffer to receive the data to be copied.

src a pointer to the source buffer supplying the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

a pointer to the specified destination buffer.

Definition at line 72 of file memory.c.

Referenced by `aes_artifact_decrypt()`, `ar_append()`, `auth_response()`, `client_read()`, `client_read_line()`, `con_read()`, `con_read_line()`, `imap_parse_literal()`, `st_trim()`, `stacie_decrypt()`, and `stacie_encrypt()`.

5.48.1.8 void* mm_set (void *block, uint8_t set, size_t len)

Sets a block of memory to a specified value.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be set.

set the byte value to be written to block.

len the number of times to write the value of the byte repeatedly to block.

Returns:

a pointer to the block of memory passed to the function.

See also:

<http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html>

Definition at line 86 of file memory.c.

Referenced by mm_alloc(), mm_sec_free(), mm_sec_stop(), mm_wipe(), ns_wipe(), st_alloc_opts(), and st_set().

5.48.1.9 void* mm_wipe (void * *block*, size_t *len*)

Zero out a block of memory.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be zeroed.

len the number of zero bytes to write to memory.

See also:

Duplicate a block of memory.
- **bool_t mm_empty** (void *block, size_t len)
Determine whether the memory buffer and/or its length encompass an empty block.
- void **mm_free** (void *block)
Free a block of memory.
- void * **mm_move** (void *dst, void *src, size_t len)
Copy the contents of one buffer into another one, allowing for overlapping data.
- void * **mm_set** (void *block, uint8_t set, size_t len)
Sets a block of memory to a specified value.
- void * **mm_wipe** (void *block, size_t len)
Zero out a block of memory.

5.49.2.2 uchr_t bitwise_and (uchr_t a, uchr_t b) [inline]

Performs a bitwise AND operation on two octets and returns the result as a single octet.

Definition at line 44 of file bitwise.c.

Referenced by st_and().

5.49.2.3 uint_t bitwise_count (uint64_t value)

bitwise.c bitwise.c

Parameters:

value an unsigned 64-bit value to be checked.

Returns:

the number of bits in value that are set.

Definition at line 15 of file bitwise.c.

Referenced by hashed_bucket(), slots_count(), and st_valid_opts().

5.49.2.4 uchr_t bitwise_or (uchr_t a, uchr_t b) [inline]

Performs a bitwise OR operation on two octets and returns the result as a single octet.

Definition at line 30 of file bitwise.c.

Referenced by st_or().

5.49.2.5 uchr_t bitwise_xor (uchr_t a, uchr_t b) [inline]

Performs a bitwise XOR operation on two octets and returns the result as a single octet.

Definition at line 37 of file bitwise.c.

Referenced by st_xor().

5.49.2.6 void* mm_alloc (size_t len)

[memory.c](#) [memory.c](#)

Note:

Uses the 'malloc' function attribute to indicate any non-NULL return value is not an alias for any other valid pointer.
The buffer length must be non-zero.

See also:

<http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html>

Parameters:

len the amount of memory to allocate.

Returns:

a valid pointer to the allocated memory on success, or NULL on error.

Definition at line 182 of file memory.c.

References log_pedantic, and mm_set().

Referenced by _serialize_ec_privkey(), _serialize_ec_pubkey(), alert_alloc(), alias_alloc(), auth_alloc(), auth_legacy_alloc(), auth_stacie_alloc(), cache_alloc(), client_connect(), compress_alloc(), compress_lzo(), con_init(), con_print(), contact_alloc(), contact_detail_alloc(), cryptex_alloc(), deprecated_cryptex_alloc(), deprecated_ecies_decrypt(), deprecated_ecies_key_public_bin(), deprecated_scramble_alloc(), dkim_memory_alloc(), domain_alloc(), ecies_decrypt(), ecies_key_public_bin(), ed25519_alloc(), encrypted_chunk_alloc(), encrypted_message_alloc(), ephemeral_chunk_alloc(), hashed_alloc(), hashed_bucket_alloc(), hashed_cursor_alloc(), http_data_header_parse_line(), http_data_value_parse(), http_load_file(), http_page_get(), imap_append_message(), imap_copy(), imap_fetch_response_add(), imap_folder_create(), imap_folder_rename(), imap_parse_dataitems(), keks_alloc(), linked_alloc(), linked_append(), linked_cursor_alloc(), linked_insert(), linked_record_alloc(), magma_folder_alloc(), mail_cache_set(), mail_create_message(), mail_message(), mail_mime_part(), message_alloc(), meta_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), ns_alloc(), ns_dupe(), ns_import(), nvp_alloc(), org_key_alloc(), org_key_generate(), org_signet_alloc(), org_signet_generate(), pool_alloc(), portal_endpoint_attachments_add(), portal_endpoint_messages_compose(), prime_alloc(), prime_object_alloc(), process_start(), queue_init(), register_session_generate(), register_session_get(), relay_alloc(), requeue(), res_bind_create(), res_row_store(), res_table_alloc(), scramble_alloc(), servers_alloc(), sess_create(), signature_tree_alloc(), slots_alloc(), smtp_add_bypass_entry(), smtp_add_recipient(), smtp_fetch_authorization(), smtp_fetch_inbound(), ssl_start(), st_alloc_opts(), st_realloc(), stacker_alloc(), stacker_push(), stmt_start(), system_init_impersonation(), tank_start(), tank_store(), tcp_addr_ip(), teacher_data_fetch(), teacher_data_get(), thread_alloc(), tls_print(), tree_alloc(), tree_cursor_alloc(), user_config_alloc(), user_config_entry_alloc(), user_key_alloc(), user_key_generate(), user_request_generate(), user_request_rotation(), user_request_sign(), and user_signet_alloc().

5.49.2.7 void mm_cleanup_variadic (ssize_t len, ...)

A checked cleanup function which can be used free a variable number memory buffers.

See also:

[mm_free](#)

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 18 of file memory.c.

References mm_free().

5.49.2.8 void* mm_copy (void *dst, const void *src, size_t len)

Copy data from one buffer to another.

Note:

For overlapping data regions, bl_move() must be used.

Warning:

This function performs an aligned copy so data directly after the src buffer may end up inside the dst buffer.

Parameters:

dst the destination buffer of the copy operation.

src the source buffer of the copy operation.

len the length, in bytes, of the data to be copied.

Returns:

a pointer to the destination buffer.

Definition at line 59 of file memory.c.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), alert_alloc(), alias_alloc(), chunk_buffer_size(), chunk_header_size(), chunk_header_write(), client_connect(), contact_alloc(), contact_detail_alloc(), deprecated_scramble_encrypt(), deserialize_ns(), deserialize_st(), domain_alloc(), ed25519_generate(), ed25519_private_get(), ed25519_private_set(), ed25519_public_get(), ed25519_public_set(), encrypted_chunk_get(), encrypted_chunk_set(), imap_folder_create(), imap_folder_rename(), imap_parse_literal(), ip_copy(), magma_folder_alloc(), message_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), mm_sec_realloc(), naked_message_set(), net_trigger(), ns_append(), ns_dupe(), ns_import(), prime_field_write(), prime_header_read(), prime_header_write(), prime_reader_size(), res_row_store(), scramble_encrypt(), serialize_ns(), serialize_st(), smtp_auth_plain(), st_append_opts(), st_append_out(), st_copy_in(), st_dupe_opts(), st_import_opts(), st_merge_opts(), st_nullify(), st_realloc(), st_write_variadic(), tank_load(), tank_store(), tcp_addr_ip(), tree_cursor_next(), tree_delete(), and user_config_entry_alloc().

5.49.2.9 void* mm_dupe (void *block, size_t len)

Duplicate a block of memory.

Parameters:

block a pointer to the block of memory to be duplicated.

len the length, in bytes, of the buffer to be duplicated.

Returns:

a freshly allocated buffer containing a copy of the input data.

Definition at line 153 of file memory.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by contact_name(), imap_command_log_safe(), imap_narrow_folders(), and meta_message_dupe().

5.49.2.10 bool_t mm_empty (void * *block*, size_t *len*)

Determine whether the memory buffer and/or its length encompass an empty block.

Parameters:

block a pointer to the block of memory to be assessed.

len the length, in bytes, of the memory block.

Returns:

false if block is NULL or len is 0; true otherwise.

Definition at line 41 of file memory.c.

Referenced by line_pl_bl(), mm_cmp_ci_eq(), mm_cmp_cs_eq(), str_tok_get_bl(), str_tok_get_count_bl(), tok_get_count_bl(), and tok_get_ns().

5.49.2.11 void mm_free (void * *block*)

Free a block of memory.

Note:

block can point to either a secure or insecure memory block.

Parameters:

block a pointer to the block to be freed.

Returns:

This function does not return any value.

Definition at line 129 of file memory.c.

References log_pedantic, and mm_sec_secured().

Referenced by ar_append(), ar_free(), auth_free(), auth_legacy_free(), auth_stacie_free(), cache_free(), cache_get(), cache_get_u64(), client_close(), client_connect(), compress_cleanup(), compress_free(), compress_lzo(), con_destroy(), con_init(), con_print(), config_free(), contact_alloc(), contact_free(), contact_name(), deprecated_ecies_key_public_bin(), deprecated_scramble_cleanup(), deprecated_scramble_free(), dequeue(), dkim_memory_free(), ecies_key_public_bin(), ed25519_free(), encrypted_chunk_free(), encrypted_message_free(), ephemeral_chunk_free(), hashed_alloc(), hashed_cursor_free(), hashed_delete(), hashed_free(), hashed_truncate(), http_data_free(), http_free_content(), http_page_free(), imap_append_message(), imap_command_log_safe(), imap_copy(), imap_fetch_free_items(), imap_fetch_response_add(), imap_fetch_response_free(), imap_folder_create(), imap_folder_rename(), imap_message_copier(), imap_narrow_folders(), inx_free(), keks_free(), linked_append(), linked_cursor_free(), linked_delete(), linked_insert(), linked_record_free(), linked_truncate(), magma_folder_alloc(), magma_folder_free(), mail_cache_destroy(), mail_cache_reset(), mail_cache_set(), mail_create_message(), mail_destroy(), mail_destroy_message(), mail_message(), mail_mime_free(), message_alloc(), meta_alloc(), meta_data_fetch_alerts(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_folders_stats_tags(), meta_free(), meta_message_free(), meta_messages_copier(), mm_cleanup_variadic(), net_listen(), ns_free(), nvp_alloc(), nvp_free(), org_key_free(), org_signet_free(), pool_alloc(), pool_free(), prime_free(), prime_key_generate(), prime_object_free(), process_start(), process_stop(), protocol_secure(), register_session_free(), relay_free(), res_bind_free(), res_table_free(), scramble_cleanup(), scramble_free(), servers_free(), sess_create(), sess_destroy(), sess_release_attachment(), sess_release_composition(), signature_tree_free(), slots_free(), smtp_add_bypass_entry(), smtp_add_recipient(), smtp_fetch_authorization(), smtp_fetch_inbound(), smtp_free_inbound(), smtp_free_outbound(), smtp_free_recipients(), smtp_list_free_filter(), ssl_stop(), st_alloc_opts(), st_data_set(), st_free(), st_realloc(), stacker_alloc(), stacker_free(), stacker_pop(), stmt_stop(), system_init_impersonation(), tank_stop(), tank_store(), teacher_data_free(), thread_alloc(), tls_print(), tree_alloc(), tree_cursor_free(), user_config_alloc(), user_config_entry_free(), user_config_free(), user_key_free(), user_signet_free(), warehouse_fetch_domains(), and xml_dump_doc().

5.49.2.12 void* mm_move (void * *dst*, void * *src*, size_t *len*)

Copy the contents of one buffer into another one, allowing for overlapping data.

See also:

`memmove()`

Parameters:

dst a pointer to the destination buffer to receive the data to be copied.

src a pointer to the source buffer supplying the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

a pointer to the specified destination buffer.

Definition at line 72 of file `memory.c`.

Referenced by `aes_artifact_decrypt()`, `ar_append()`, `auth_response()`, `client_read()`, `client_read_line()`, `con_read()`, `con_read_line()`, `imap_parse_literal()`, `st_trim()`, `stacie_decrypt()`, and `stacie_encrypt()`.

5.49.2.13 void* mm_sec_alloc (size_t *len*)

Allocate a chunk of memory from the secure memory slab.

See also:

[mm_sec_chunk_new\(\)](#)

Parameters:

len the length, in bytes, of the secure memory chunk to be allocated.

Returns:

NULL on failure, or a pointer to the freshly allocated chunk of secure memory on success.

Definition at line 251 of file `secure.c`.

References `align()`, `bytes`, `items`, `log_options`, `log_pedantic`, `M_LOG_PEDANTIC`, `M_LOG_STACK_TRACE`, `mm_sec_chunk_new()`, `mm_sec_stats()`, `mm_wipe()`, `mutex_lock()`, `mutex_unlock()`, and `secured_t`.

Referenced by `deprecated_ecies_key_private_bin()`, `ecies_key_private_bin()`, `mm_sec_realloc()`, `ssl_start()`, `st_alloc_opts()`, and `st_realloc()`.

5.49.2.14 void mm_sec_cleanup (void * *block*)

Performed a checked memory free.

See also:

[mm_sec_free](#)

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 236 of file `secure.c`.

References `mm_sec_free()`.

5.49.2.15 void mm_sec_free (void * *block*)

Free a secure memory block and perform a multi-pass wipe of its contents.

Returns:

This function returns no value.

Definition at line 196 of file secure.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_merge(), mm_sec_secured(), mm_set(), mutex_lock(), mutex_unlock(), and secured_t.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), mm_sec_cleanup(), mm_sec_realloc(), ssl_start(), st_alloc_opts(), st_data_set(), st_free(), and st_realloc().

5.49.2.16 void* mm_sec_realloc (void * *orig*, size_t *len*)

Allocates a larger block of secure memory if requested. Depends on allocation/free routines to lock the required mutex. If a new block is allocated, the original data is copied and then the block is freed. In the event of an error, the original block is preserved and NULL is returned.

Definition at line 296 of file secure.c.

References log_pedantic, mm_copy(), mm_sec_alloc(), mm_sec_free(), and secured_t.

5.49.2.17 bool_t mm_sec_secured (void * *block*)

Determine whether the data pointer falls within the secure memory block.

Parameters:

block the data pointer to be tested.

Returns:

true if block points to secure data; false if not, or if block is invalid or secure memory is disabled.

Definition at line 80 of file secure.c.

References slab.

Referenced by mm_free(), mm_sec_chunk_new(), mm_sec_chunk_next(), mm_sec_free(), and st_data_set().

5.49.2.18 bool_t mm_sec_start (void)

If enabled, allocate and initialize the secure memory slab.

Note:

This function will mmap a page-aligned secure memory slab (defaults to 32768 bytes long), mlock() it into memory, and zero-wipe it. Guard pages with empty permissions are created on the boundaries of the slab to prevent memory bungling.

Returns:

true if the secure memory slab has been initialized, or false if the process fails.

Definition at line 357 of file secure.c.

References log_pedantic, magma, magma_t::memory, MEMORYBUF, MM_SEC_PAGE_ALIGNMENT_MIN, MM_SEC_POOL_LENGTH_MIN, mm_wipe(), magma_t::page_length, magma_t::secure, and secured_t.

Referenced by process_start().

5.49.2.19 bool_t mm_sec_stats (size_t * total, size_t * bytes, size_t * items)

Get the collected secure memory statistics for the caller.

Parameters:

total a pointer to a size_t variable that will store the secure memory region length, in bytes.

bytes a pointer to a size_t variable that will store the number of secure bytes allocated by magma.

items a pointer to a size_t variable that will store the number of secure memory allocations requested by magma.

Returns:

true on success or false on failure.

Definition at line 60 of file secure.c.

References mutex_lock(), and mutex_unlock().

Referenced by mm_sec_alloc(), and stats_derived_value().

5.49.2.20 void mm_sec_stop (void)

Deallocate and perform a multi-stage secure wipe of the secure memory region.

Returns:

This function returns no value.

Definition at line 328 of file secure.c.

References mm_set().

Referenced by process_stop().

5.49.2.21 void* mm_set (void * block, uint8_t set, size_t len)

Sets a block of memory to a specified value.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be set.

set the byte value to be written to block.

len the number of times to write the value of the byte repeatedly to block.

Returns:

a pointer to the block of memory passed to the function.

See also:

<http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html>

Definition at line 86 of file memory.c.

Referenced by mm_alloc(), mm_sec_free(), mm_sec_stop(), mm_wipe(), ns_wipe(), st_alloc_opts(), and st_set().

5.49.2.22 void* mm_wipe (void * *block*, size_t *len*)

Zero out a block of memory.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be zeroed.

len the number of zero bytes to write to memory.

See also:

<http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html>

Definition at line 108 of file memory.c.

5.50.2.3 void mm_sec_chunk_merge (secured_t * chunk)

If an adjacent region is available, merge them together.

Definition at line 135 of file secure.c.

References MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_next(), mm_sec_chunk_prev(), and secured_t.

Referenced by mm_sec_chunk_new(), and mm_sec_free().

5.50.2.4 secured_t* mm_sec_chunk_new (secured_t * block, size_t size)

Locates a properly sized chunk of memory and reserves it.

Definition at line 157 of file secure.c.

References MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_merge(), mm_sec_chunk_next(), mm_sec_secured(), and secured_t.

Referenced by mm_sec_alloc().

5.50.2.5 `secured_t* mm_sec_chunk_next (secured_t * chunk)`

Get the next chunk of secure memory.

Parameters:

chunk the input secure chunk.

Returns:

a pointer to the next chunk of secure memory, or NULL on failure or if the end of the slab is reached.

Definition at line 102 of file `secure.c`.

References `mm_sec_secured()`, and `secured_t`.

Referenced by `mm_sec_chunk_merge()`, `mm_sec_chunk_new()`, and `mm_sec_chunk_prev()`.

5.50.2.6 `secured_t* mm_sec_chunk_prev (secured_t * chunk)`

Get the previous chunk of secure memory.

Parameters:

chunk the input secure chunk.

Returns:

a pointer to the previous chunk of secure memory, or NULL on failure or if the beginning of the slab is reached.

Definition at line 117 of file `secure.c`.

References `mm_sec_chunk_next()`, and `secured_t`.

Referenced by `mm_sec_chunk_merge()`.

5.50.2.7 `void mm_sec_cleanup (void * block)`

Performed a checked memory free.

See also:

[mm_sec_free](#)

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 236 of file `secure.c`.

References `mm_sec_free()`.

5.50.2.8 `void mm_sec_free (void * block)`

Free a secure memory block and perform a multi-pass wipe of its contents.

Returns:

This function returns no value.

Definition at line 196 of file secure.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_merge(), mm_sec_secured(), mm_set(), mutex_lock(), mutex_unlock(), and secured_t.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), mm_sec_cleanup(), mm_sec_realloc(), ssl_start(), st_alloc_opts(), st_data_set(), st_free(), and st_realloc().

5.50.2.9 void* mm_sec_realloc (void * orig, size_t len)

Allocates a larger block of secure memory if requested. Depends on allocation/free routines to lock the required mutex. If a new block is allocated, the original data is copied and then the block is freed. In the event of an error, the original block is preserved and NULL is returned.

Definition at line 296 of file secure.c.

References log_pedantic, mm_copy(), mm_sec_alloc(), mm_sec_free(), and secured_t.

5.50.2.10 bool_t mm_sec_secured (void * block)

Determine whether the data pointer falls within the secure memory block.

Parameters:

block the data pointer to be tested.

Returns:

true if block points to secure data; false if not, or if block is invalid or secure memory is disabled.

Definition at line 80 of file secure.c.

References slab.

Referenced by mm_free(), mm_sec_chunk_new(), mm_sec_chunk_next(), mm_sec_free(), and st_data_set().

5.50.2.11 bool_t mm_sec_start (void)

If enabled, allocate and initialize the secure memory slab.

Note:

This function will mmap a page-aligned secure memory slab (defaults to 32768 bytes long), mlock() it into memory, and zero-wipe it. Guard pages with empty permissions are created on the boundaries of the slab to prevent memory bungling.

Returns:

true if the secure memory slab has been initialized, or false if the process fails.

Definition at line 357 of file secure.c.

References log_pedantic, magma, magma_t::memory, MEMORYBUF, MM_SEC_PAGE_ALIGNMENT_MIN, MM_SEC_POOL_LENGTH_MIN, mm_wipe(), magma_t::page_length, magma_t::secure, and secured_t.

Referenced by process_start().

5.50.2.12 `bool_t mm_sec_stats (size_t * total, size_t * bytes, size_t * items)`

Get the collected secure memory statistics for the caller.

Parameters:

total a pointer to a `size_t` variable that will store the secure memory region length, in bytes.

bytes a pointer to a `size_t` variable that will store the number of secure bytes allocated by magma.

items a pointer to a `size_t` variable that will store the number of secure memory allocations requested by magma.

Returns:

true on success or false on failure.

Definition at line 60 of file `secure.c`.

References `mutex_lock()`, and `mutex_unlock()`.

Referenced by `mm_sec_alloc()`, and `stats_derived_value()`.

5.50.2.13 `void mm_sec_stop (void)`

Deallocate and perform a multi-stage secure wipe of the secure memory region.

Returns:

This function returns no value.

Definition at line 328 of file `secure.c`.

References `mm_set()`.

Referenced by `process_stop()`.

Functions

- [uchr_t upper_chr](#) ([uchr_t](#) *c*)
Return the uppercase representation of a character.
- [uchr_t lower_chr](#) ([uchr_t](#) *c*)
Return the lowercase representation of a character.
- [stringer_t * upper_st](#) ([stringer_t](#) **s*)
Transform a managed string (in-place) into uppercase.
- [stringer_t * lower_st](#) ([stringer_t](#) **s*)
Transform a managed string (in-place) into lowercase.

5.51.1 Function Documentation

5.51.1.1 [uchr_t lower_chr](#) ([uchr_t](#) *c*)

Return the lowercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in lowercase.

Definition at line 25 of file case.c.

Referenced by [auth_sanitize_address\(\)](#), [hex_decode_chr\(\)](#), [mm_cmp_ci_eq\(\)](#), [pop_user_parse\(\)](#), [smtp_parse_helo_domain\(\)](#), [smtp_parse_mail_from_path\(\)](#), [smtp_parse_rcpt_to\(\)](#), [st_cmp_ci_ends\(\)](#), [st_cmp_ci_eq\(\)](#), [st_cmp_ci_starts\(\)](#), and [st_search_ci\(\)](#).

5.51.1.2 [stringer_t * lower_st](#) ([stringer_t](#) * *s*)

Transform a managed string (in-place) into lowercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in lowercase.

Definition at line 58 of file case.c.

References [log_pedantic](#), and [st_empty_out\(\)](#).

Referenced by [contact_business_valid_email\(\)](#), [http_parse_header\(\)](#), [register_business_step1\(\)](#), and [smtp_rcpt_to\(\)](#).

5.51.1.3 `uchr_t upper_chr (uchr_t c)`

Return the uppercase representation of a character.

Parameters:

`c` the character to be transformed.

Returns:

the input character, in uppercase.

Definition at line 15 of file case.c.

5.51.1.4 `stringer_t* upper_st (stringer_t * s)`

Transform a managed string (in-place) into uppercase.

Parameters:

`s` the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in uppercase.

Definition at line 35 of file case.c.

References `log_pedantic`, and `st_empty_out()`.

Referenced by `http_response_allow_cross()`, `imap_fetch_body_tag()`, `imap_fetch_bodystructure()`, and `mail_mime_type_parameters()`.

```
#include "magma.h"
```

Functions

- [placer_t line_pl_bl](#) (char *block, size_t length, uint64_t number)
Get a placer pointing to the specified line (' delimited) of content in a data buffer.
- [placer_t line_pl_ns](#) (char *string, uint64_t number)
Get a placer pointing to the specified line (' delimited) of a null-terminated string.
- [placer_t line_pl_st](#) (stringer_t *string, uint64_t number)
Get a placer pointing to the specified line (' delimited) of a managed string.
- [placer_t line_pl_pl](#) (placer_t string, uint64_t number)
Get a placer pointing to the specified line (' delimited) of another placer.

5.54.1 Function Documentation

5.54.1.1 [placer_t line_pl_bl](#) (char * *block*, size_t *length*, uint64_t *number*)

Get a placer pointing to the specified line ('
' delimited) of content in a data buffer.

Parameters:

- block*** a pointer to the block of data to be scanned.
- length*** the length, in bytes, of the specified data buffer.
- number*** the zero-based index of the line to be retrieved from the buffer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 17 of file line.c.

References [log_pedantic](#), [mm_empty\(\)](#), [pl_init\(\)](#), and [pl_null\(\)](#).

Referenced by [line_pl_ns\(\)](#), [line_pl_pl\(\)](#), and [line_pl_st\(\)](#).

5.54.1.2 [placer_t line_pl_ns](#) (char * *string*, uint64_t *number*)

Get a placer pointing to the specified line ('
' delimited) of a null-terminated string.

See also:

[line_pl_bl\(\)](#)

Parameters:

- string* a pointer to a null-terminated string to be scanned.
- number* the zero-based index of the line to be retrieved from the string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 60 of file line.c.

References line_pl_bl(), and ns_length_get().

5.54.1.3 placer_t line_pl_pl (placer_t *string*, uint64_t *number*)

Get a placer pointing to the specified line (‘
’ delimited) of another placer.

Parameters:

- string* a pointer to the placer to be scanned.
- number* the zero-based index of the line to be retrieved from the placer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 82 of file line.c.

References line_pl_bl(), pl_char_get(), and pl_length_get().

5.54.1.4 placer_t line_pl_st (stringer_t * *string*, uint64_t *number*)

Get a placer pointing to the specified line (‘
’ delimited) of a managed string.

Parameters:

- string* a pointer to the managed string to be scanned.
- number* the zero-based index of the line to be retrieved from the managed string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 71 of file line.c.

References line_pl_bl(), st_char_get(), and st_length_get().

Referenced by client_read_line(), con_read_line(), and imap_parse_literal().

Ensure a number is between the min and max values, otherwise return the boundary value.
- `int64_t int64_clamp` (`int64_t min`, `int64_t max`, `int64_t number`)
Ensure a number is between the min and max values, otherwise return the boundary value.

5.55.1 Function Documentation

5.55.1.1 `int16_t int16_clamp` (`int16_t min`, `int16_t max`, `int16_t number`)

Ensure a number is between the min and max values, otherwise return the boundary value. [clamp.c](#)

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 125 of file `clamp.c`.

References `log_pedantic`.

5.55.1.2 int32_t int32_clamp (int32_t min, int32_t max, int32_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 146 of file clamp.c.

References log_pedantic.

5.55.1.3 int64_t int64_clamp (int64_t min, int64_t max, int64_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 167 of file clamp.c.

References log_pedantic.

5.55.1.4 int8_t int8_clamp (int8_t min, int8_t max, int8_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 104 of file clamp.c.

References log_pedantic.

5.55.1.5 uint16_t uint16_clamp (uint16_t min, uint16_t max, uint16_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 41 of file clamp.c.

References log_pedantic.

5.55.1.6 uint32_t uint32_clamp (uint32_t min, uint32_t max, uint32_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 62 of file clamp.c.

References log_pedantic.

5.55.1.7 uint64_t uint64_clamp (uint64_t min, uint64_t max, uint64_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 83 of file clamp.c.

References log_pedantic.

Referenced by stacie_derive_rounds(), and stmt_exec_affected_conn().

5.55.1.8 uint8_t uint8_clamp (uint8_t *min*, uint8_t *max*, uint8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 20 of file clamp.c.

Functions

- `size_t uint64_digits (uint64_t number)`
Count the number of digits needed to represent a base-10 64-bit unsigned integer.
- `size_t uint32_digits (uint32_t number)`
Count the number of digits needed to represent a base-10 32-bit unsigned integer.
- `size_t uint16_digits (uint16_t number)`
Count the number of digits needed to represent a base-10 16-bit unsigned integer.
- `size_t uint8_digits (uint8_t number)`
Count the number of digits needed to represent a base-10 8-bit unsigned integer.
- `size_t int64_digits (int64_t number)`
Count the number of digits needed to represent a base-10 64-bit signed integer.
- `size_t int32_digits (int32_t number)`
Count the number of digits needed to represent a base-10 32-bit signed integer.
- `size_t int16_digits (int16_t number)`
Count the number of digits needed to represent a base-10 16-bit signed integer.
- `size_t int8_digits (int8_t number)`
Count the number of digits needed to represent a base-10 8-bit signed integer.

5.56.1 Function Documentation

5.56.1.1 `size_t int16_digits (int16_t number)`

Count the number of digits needed to represent a base-10 16-bit signed integer. [digits.c](#)

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 112 of file `digits.c`.

References `length`.

Referenced by `serialize_int16()`.

5.56.1.2 `size_t int32_digits (int32_t number)`

Count the number of digits needed to represent a base-10 32-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 93 of file digits.c.

References length.

Referenced by serialize_int32().

5.56.1.3 size_t int64_digits (int64_t *number*)

Count the number of digits needed to represent a base-10 64-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 74 of file digits.c.

References length.

Referenced by serialize_int64().

5.56.1.4 size_t int8_digits (int8_t *number*)

Count the number of digits needed to represent a base-10 8-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 131 of file digits.c.

References length.

5.56.1.5 size_t uint16_digits (uint16_t *number*)

Count the number of digits needed to represent a base-10 16-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 44 of file digits.c.

References length.

Referenced by serialize_uint16().

5.56.1.6 size_t uint32_digits (uint32_t *number*)

Count the number of digits needed to represent a base-10 32-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 29 of file digits.c.

References length.

Referenced by serialize_uint32().

5.56.1.7 `size_t uint64_digits (uint64_t number)`

Count the number of digits needed to represent a base-10 64-bit unsigned integer.

Returns:

the number of digits needed to represent specified integer.

Definition at line 14 of file digits.c.

References length.

Referenced by mail_build_signature(), serialize_uint64(), sess_key(), and smtp_store_spamsig().

5.56.1.8 `size_t uint8_digits (uint8_t number)`

Count the number of digits needed to represent a base-10 8-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 59 of file digits.c.

References length.

Functions

- [bool_t float_conv](#) ([stringer_t](#) *s, [float_t](#) *number)
Convert a managed string to a float.
- [bool_t double_conv](#) ([stringer_t](#) *s, [double_t](#) *number)
Convert a managed string to a double.
- [bool_t size_conv_bl](#) (void *block, [size_t](#) length, [size_t](#) *number)
Convert a numerical string into a size_t value.
- [bool_t ssize_conv_bl](#) (void *block, [size_t](#) length, [ssize_t](#) *number)
Convert a numerical string into an ssize_t value.
- [bool_t uint64_conv_bl](#) (void *block, [size_t](#) length, [uint64_t](#) *number)
Convert a numerical string into an unsigned 64-bit integer.
- [bool_t uint64_conv_ns](#) (char *string, [uint64_t](#) *number)
Convert a null-terminated string into an unsigned 64-bit integer.
- [bool_t uint64_conv_st](#) ([stringer_t](#) *string, [uint64_t](#) *number)
Convert a managed string into an unsigned 64-bit integer.
- [bool_t uint64_conv_pl](#) ([placer_t](#) string, [uint64_t](#) *number)
Convert a placer into an unsigned 64-bit integer.
- [bool_t uint32_conv_bl](#) (void *block, [size_t](#) length, [uint32_t](#) *number)
Convert a numerical string into an unsigned 32-bit integer.
- [bool_t uint32_conv_ns](#) (char *string, [uint32_t](#) *number)
Convert a null-terminated string into an unsigned 32-bit integer.
- [bool_t uint32_conv_st](#) ([stringer_t](#) *string, [uint32_t](#) *number)
Convert a managed string into an unsigned 32-bit integer.
- [bool_t uint16_conv_bl](#) (void *block, [size_t](#) length, [uint16_t](#) *number)
Convert a numerical string to a 16-bit unsigned integer.
- [bool_t uint16_conv_ns](#) (char *string, [uint16_t](#) *number)
Convert a numerical string to a 16-bit unsigned integer.
- [bool_t uint16_conv_st](#) ([stringer_t](#) *string, [uint16_t](#) *number)
Convert a numerical string to a 16-bit unsigned integer.
- [bool_t uint8_conv_bl](#) (void *block, [size_t](#) length, [uint8_t](#) *number)
Convert a numerical string to an unsigned 8-bit unsigned integer.
- [bool_t uint8_conv_ns](#) (char *string, [uint8_t](#) *number)

Convert a numerical string to an 8-bit unsigned integer.

- `bool_t uint8_conv_st (stringer_t *string, uint8_t *number)`

Convert a numerical string to an 8-bit unsigned integer.

- `bool_t int64_conv_bl (void *block, size_t length, int64_t *number)`

Convert a numerical string into a signed 64-bit integer.

- `bool_t int64_conv_ns (char *string, int64_t *number)`

Convert a null-terminated string into a signed 64-bit integer.

- `bool_t int64_conv_st (stringer_t *string, int64_t *number)`

Convert a managed string into a signed 64-bit integer.

- `bool_t int32_conv_bl (void *block, size_t length, int32_t *number)`

Convert a numerical string into a signed 32-bit integer.

- `bool_t int32_conv_ns (char *string, int32_t *number)`

Convert a null-terminated string into a signed 32-bit integer.

- `bool_t int32_conv_st (stringer_t *string, int32_t *number)`

Convert a managed string into a signed 32-bit integer.

- `bool_t int16_conv_bl (void *block, size_t length, int16_t *number)`

Convert a numerical string into a signed 16-bit integer.

- `bool_t int16_conv_ns (char *string, int16_t *number)`

Convert a null-terminated string into a signed 16-bit integer.

- `bool_t int16_conv_st (stringer_t *string, int16_t *number)`

Convert a managed string into a signed 16-bit integer.

- `bool_t int8_conv_bl (void *block, size_t length, int8_t *number)`

Convert a numerical string into a signed 8-bit integer.

- `bool_t int8_conv_ns (char *string, int8_t *number)`

Convert a null-terminated string into a signed 8-bit integer.

- `bool_t int8_conv_st (stringer_t *string, int8_t *number)`

Convert a managed string into a signed 8-bit integer.

- `stringer_t * uint32_put_no (uint32_t val)`

Create a stringer, storing a 4-byte value in network byte order.

- `stringer_t * uint24_put_no (uint32_t val)`

Create a stringer, storing a 3-byte value in network byte order.

- `stringer_t * uint16_put_no (uint16_t val)`

Create a stringer, storing a 2-byte value in network byte order.

- `uint32_t uint32_get_no (stringer_t *s)`

Fetch a 4 byte network order value from a stringer and return it in host byte order.

- `uint32_t uint24_get_no (stringer_t *s)`

Fetch a 3 byte network order value from a stringer and return it in host byte order.

- `uint16_t uint16_get_no (stringer_t *s)`

Fetch a 2 byte network order value from a stringer and return it in host byte order.

5.57.1 Function Documentation

5.57.1.1 `bool_t double_conv (stringer_t *s, double_t *number)`

Convert a managed string to a double. [numbers.c](#)

Parameters:

s the managed string to be converted.

number a pointer to a double where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 48 of file numbers.c.

References `log_pedantic`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

5.57.1.2 `bool_t float_conv (stringer_t *s, float_t *number)`

Convert a managed string to a float.

Parameters:

s the managed string to be converted.

number a pointer to a float where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 16 of file numbers.c.

References `log_pedantic`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

5.57.1.3 `bool_t int16_conv_bl (void *block, size_t length, int16_t *number)`

Convert a numerical string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 559 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int16(), int16_conv_ns(), and int16_conv_st().

5.57.1.4 bool_t int16_conv_ns (char * *string*, int16_t * *number*)

Convert a null-terminated string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 615 of file numbers.c.

References int16_conv_bl(), and ns_length_get().

5.57.1.5 bool_t int16_conv_st (stringer_t * *string*, int16_t * *number*)

Convert a managed string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 626 of file numbers.c.

References int16_conv_bl(), st_data_get(), and st_length_get().

Referenced by xml_get_xpath_int16().

5.57.1.6 bool_t int32_conv_bl (void * *block*, size_t *length*, int32_t * *number*)

Convert a numerical string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.
length the length, in bytes, of the numerical data.
number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 480 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int32(), http_parse_header(), imap_fetch_parse_partial(), int32_conv_ns(), and int32_conv_st().

5.57.1.7 bool_t int32_conv_ns (char * *string*, int32_t * *number*)

Convert a null-terminated string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.
number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 536 of file numbers.c.

References int32_conv_bl(), and ns_length_get().

Referenced by process_find_pid(), and process_kill().

5.57.1.8 bool_t int32_conv_st (stringer_t * *string*, int32_t * *number*)

Convert a managed string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.
number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 547 of file numbers.c.

References int32_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int32().

5.57.1.9 `bool_t int64_conv_bl (void * block, size_t length, int64_t * number)`

Convert a numerical string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 401 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int64(), int64_conv_ns(), int64_conv_st(), and ssize_conv_bl().

5.57.1.10 `bool_t int64_conv_ns (char * string, int64_t * number)`

Convert a null-terminated string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 457 of file numbers.c.

References int64_conv_bl(), and ns_length_get().

5.57.1.11 `bool_t int64_conv_st (stringer_t * string, int64_t * number)`

Convert a managed string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 468 of file numbers.c.

References `int64_conv_bl()`, `st_data_get()`, and `st_length_get()`.

Referenced by `cache_set_value()`, `config_value_set()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_int64()`.

5.57.1.12 `bool_t int8_conv_bl (void * block, size_t length, int8_t * number)`

Convert a numerical string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 638 of file numbers.c.

References `data`, and `log_pedantic`.

Referenced by `int8_conv_ns()`, and `int8_conv_st()`.

5.57.1.13 `bool_t int8_conv_ns (char * string, int8_t * number)`

Convert a null-terminated string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 694 of file numbers.c.

References `int8_conv_bl()`, and `ns_length_get()`.

5.57.1.14 `bool_t int8_conv_st (stringer_t * string, int8_t * number)`

Convert a managed string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 705 of file numbers.c.

References `int8_conv_bl()`, `st_data_get()`, and `st_length_get()`.

Referenced by `cache_set_value()`, `config_value_set()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_int8()`.

5.57.1.15 bool_t size_conv_bl (void * block, size_t length, size_t * number)

Convert a numerical string into a size_t value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an size_t value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 82 of file numbers.c.

References `uint64_conv_bl()`.

Referenced by `http_body()`.

5.57.1.16 bool_t ssize_conv_bl (void * block, size_t length, ssize_t * number)

Convert a numerical string into an ssize_t value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an ssize_t value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 94 of file numbers.c.

References `int64_conv_bl()`.

5.57.1.17 bool_t uint16_conv_bl (void * *block*, size_t *length*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.

length the length, in bytes, of the numerical string.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 259 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint16(), uint16_conv_ns(), and uint16_conv_st().

5.57.1.18 bool_t uint16_conv_ns (char * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 307 of file numbers.c.

References ns_length_get(), and uint16_conv_bl().

5.57.1.19 bool_t uint16_conv_st (stringer_t * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 318 of file numbers.c.

References `st_data_get()`, `st_length_get()`, and `uint16_conv_bl()`.

Referenced by `cache_set_value()`, `config_value_set()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_uint16()`.

5.57.1.20 `uint16_t uint16_get_no (stringer_t * s)`

Fetch a 2 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 2 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 852 of file numbers.c.

References `data`, `log_pedantic`, `st_data_get()`, `st_empty`, and `st_length_get()`.

5.57.1.21 `stringer_t* uint16_put_no (uint16_t val)`

Create a stringer, storing a 2-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 2 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 774 of file numbers.c.

References `data`, `log_pedantic`, `st_alloc()`, `st_data_get()`, and `st_length_set()`.

5.57.1.22 `uint32_t uint24_get_no (stringer_t * s)`

Fetch a 3 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 3 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 827 of file numbers.c.

References `data`, `log_pedantic`, `st_data_get()`, `st_empty`, and `st_length_get()`.

5.57.1.23 `stringer_t* uint24_put_no (uint32_t val)`

Create a stringer, storing a 3-byte value in network byte order.

Parameters:

- s* a pointer to the data buffer where the value will be inserted.
- val* the 3 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 745 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.57.1.24 bool_t uint32_conv_bl (void * *block*, size_t *length*, uint32_t * *number*)

Convert a numerical string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

- block* a pointer to the numerical string to be converted.
- length* the length, in bytes, of the numerical data.
- number* a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 188 of file numbers.c.

References data, and log_pedantic.

Referenced by cache_config(), deserialize_uint32(), relay_config(), servers_config(), uint32_conv_ns(), and uint32_conv_st().

5.57.1.25 bool_t uint32_conv_ns (char * *string*, uint32_t * *number*)

Convert a null-terminated string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

- string* a pointer to the null-terminated string to be converted.
- number* a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 236 of file numbers.c.

References ns_length_get(), and uint32_conv_bl().

5.57.1.26 bool_t uint32_conv_st (stringer_t * *string*, uint32_t * *number*)

Convert a managed string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 247 of file numbers.c.

References st_data_get(), st_length_get(), and uint32_conv_bl().

Referenced by cache_set_value(), config_value_set(), imap_fetch_body_part(), imap_search_messages_date_compare(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint32().

5.57.1.27 uint32_t uint32_get_no (stringer_t * *s*)

Fetch a 4 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 4 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 801 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.57.1.28 stringer_t* uint32_put_no (uint32_t *val*)

Create a stringer, storing a 4-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 4 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 715 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.57.1.29 bool_t uint64_conv_bl (void * *block*, size_t *length*, uint64_t * *number*)

Convert a numerical string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 106 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint64(), imap_parse_literal(), pop_num_parse(), pop_top_parse(), size_conv_bl(), smtp_check_receive_quota(), uint64_conv_ns(), uint64_conv_pl(), and uint64_conv_st().

5.57.1.30 bool_t uint64_conv_ns (char * *string*, uint64_t * *number*)

Convert a null-terminated string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 154 of file numbers.c.

References ns_length_get(), and uint64_conv_bl().

Referenced by json_api_dispatch(), lib_load_xml(), and portal_endpoint().

5.57.1.31 bool_t uint64_conv_pl (placer_t *string*, uint64_t * *number*)

Convert a placer into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the placer to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 176 of file numbers.c.

References `pl_data_get()`, `pl_length_get()`, and `uint64_conv_bl()`.

Referenced by `build_version_major()`, `build_version_minor()`, `build_version_patch()`, `smtp_parse_mail_from_path()`, and `stamp_counter_check()`.

5.57.1.32 bool_t uint64_conv_st (stringer_t * string, uint64_t * number)

Convert a managed string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 165 of file numbers.c.

References `st_data_get()`, `st_length_get()`, and `uint64_conv_bl()`.

Referenced by `cache_set_value()`, `config_value_set()`, `imap_narrow_messages()`, `imap_search_messages_range()`, `imap_search_messages_size()`, `portal_get_upload_attachment()`, `relay_set_value()`, `servers_set_value()`, `teacher_process()`, and `xml_get_xpath_uint64()`.

5.57.1.33 bool_t uint8_conv_bl (void * block, size_t length, uint8_t * number)

Convert a numerical string to an unsigned 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.

length the length, in bytes, of the numerical string.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 330 of file numbers.c.

References `data`, and `log_pedantic`.

Referenced by `ip_subnet_st()`, `uint8_conv_ns()`, and `uint8_conv_st()`.

5.57.1.34 bool_t uint8_conv_ns (char * *string*, uint8_t * *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 378 of file numbers.c.

References ns_length_get(), and uint8_conv_bl().

5.57.1.35 bool_t uint8_conv_st (stringer_t * *string*, uint8_t * *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 389 of file numbers.c.

References st_data_get(), st_length_get(), and uint8_conv_bl().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint8().

Functions

- `size_t int16_digits (int16_t number)`
digits.c
- `size_t int32_digits (int32_t number)`
Count the number of digits needed to represent a base-10 32-bit signed integer.
- `size_t int64_digits (int64_t number)`
Count the number of digits needed to represent a base-10 64-bit signed integer.
- `size_t int8_digits (int8_t number)`
Count the number of digits needed to represent a base-10 8-bit signed integer.
- `size_t uint16_digits (uint16_t number)`
Count the number of digits needed to represent a base-10 16-bit unsigned integer.
- `size_t uint32_digits (uint32_t number)`
Count the number of digits needed to represent a base-10 32-bit unsigned integer.
- `size_t uint64_digits (uint64_t number)`
Count the number of digits needed to represent a base-10 64-bit unsigned integer.
- `size_t uint8_digits (uint8_t number)`
Count the number of digits needed to represent a base-10 8-bit unsigned integer.
- `int16_t int16_clamp (int16_t min, int16_t max, int16_t number)`
clamp.c
- `int32_t int32_clamp (int32_t min, int32_t max, int32_t number)`
Ensure a number is between the min and max values, otherwise return the boundary value.
- `int64_t int64_clamp (int64_t min, int64_t max, int64_t number)`
Ensure a number is between the min and max values, otherwise return the boundary value.
- `int8_t int8_clamp (int8_t min, int8_t max, int8_t number)`
Ensure a number is between the min and max values, otherwise return the boundary value.
- `uint16_t uint16_clamp (uint16_t min, uint16_t max, uint16_t number)`
Ensure a number is between the min and max values, otherwise return the boundary value.
- `uint32_t uint32_clamp (uint32_t min, uint32_t max, uint32_t number)`
Ensure a number is between the min and max values, otherwise return the boundary value.
- `uint64_t uint64_clamp (uint64_t min, uint64_t max, uint64_t number)`
Ensure a number is between the min and max values, otherwise return tuint_the boundary value.
- `uint8_t uint8_clamp (uint8_t min, uint8_t max, uint8_t number)`
Ensure a number is between the min and max values, otherwise return the boundary value.
- `bool_t double_conv (stringer_t *s, double_t *number)`

numbers.c

- `bool_t float_conv (stringer_t *s, float_t *number)`
Convert a managed string to a float.
- `bool_t int16_conv_bl (void *block, size_t length, int16_t *number)`
Convert a numerical string into a signed 16-bit integer.
- `bool_t int16_conv_ns (char *string, int16_t *number)`
Convert a null-terminated string into a signed 16-bit integer.
- `bool_t int16_conv_st (stringer_t *string, int16_t *number)`
Convert a managed string into a signed 16-bit integer.
- `bool_t int32_conv_bl (void *block, size_t length, int32_t *number)`
Convert a numerical string into a signed 32-bit integer.
- `bool_t int32_conv_ns (char *string, int32_t *number)`
Convert a null-terminated string into a signed 32-bit integer.
- `bool_t int32_conv_st (stringer_t *string, int32_t *number)`
Convert a managed string into a signed 32-bit integer.
- `bool_t int64_conv_bl (void *block, size_t length, int64_t *number)`
Convert a numerical string into a signed 64-bit integer.
- `bool_t int64_conv_ns (char *string, int64_t *number)`
Convert a null-terminated string into a signed 64-bit integer.
- `bool_t int64_conv_st (stringer_t *string, int64_t *number)`
Convert a managed string into a signed 64-bit integer.
- `bool_t int8_conv_bl (void *block, size_t length, int8_t *number)`
Convert a numerical string into a signed 8-bit integer.
- `bool_t int8_conv_ns (char *string, int8_t *number)`
Convert a null-terminated string into a signed 8-bit integer.
- `bool_t int8_conv_st (stringer_t *string, int8_t *number)`
Convert a managed string into a signed 8-bit integer.
- `bool_t size_conv_bl (void *block, size_t length, size_t *number)`
Convert a numerical string into a size_t value.
- `bool_t ssize_conv_bl (void *block, size_t length, ssize_t *number)`
Convert a numerical string into an ssize_t value.
- `bool_t uint16_conv_bl (void *block, size_t length, uint16_t *number)`
Convert a numerical string to a 16-bit unsigned integer.
- `bool_t uint16_conv_ns (char *string, uint16_t *number)`
Convert a numerical string to a 16-bit unsigned integer.

- `bool_t uint16_conv_st (stringer_t *string, uint16_t *number)`
Convert a numerical string to a 16-bit unsigned integer.
- `bool_t uint32_conv_bl (void *block, size_t length, uint32_t *number)`
Convert a numerical string into an unsigned 32-bit integer.
- `bool_t uint32_conv_ns (char *string, uint32_t *number)`
Convert a null-terminated string into an unsigned 32-bit integer.
- `bool_t uint32_conv_st (stringer_t *string, uint32_t *number)`
Convert a managed string into an unsigned 32-bit integer.
- `bool_t uint64_conv_bl (void *block, size_t length, uint64_t *number)`
Convert a numerical string into an unsigned 64-bit integer.
- `bool_t uint64_conv_ns (char *string, uint64_t *number)`
Convert a null-terminated string into an unsigned 64-bit integer.
- `bool_t uint64_conv_pl (placer_t string, uint64_t *number)`
Convert a placer into an unsigned 64-bit integer.
- `bool_t uint64_conv_st (stringer_t *string, uint64_t *number)`
Convert a managed string into an unsigned 64-bit integer.
- `bool_t uint8_conv_bl (void *block, size_t length, uint8_t *number)`
Convert a numerical string to an unsigned 8-bit unsigned integer.
- `bool_t uint8_conv_ns (char *string, uint8_t *number)`
Convert a numerical string to an 8-bit unsigned integer.
- `bool_t uint8_conv_st (stringer_t *string, uint8_t *number)`
Convert a numerical string to an 8-bit unsigned integer.
- `stringer_t * uint32_put_no (uint32_t val)`
Create a stringer, storing a 4-byte value in network byte order.
- `stringer_t * uint24_put_no (uint32_t val)`
Create a stringer, storing a 3-byte value in network byte order.
- `stringer_t * uint16_put_no (uint16_t val)`
Create a stringer, storing a 2-byte value in network byte order.
- `uint32_t uint32_get_no (stringer_t *s)`
Fetch a 4 byte network order value from a stringer and return it in host byte order.
- `uint32_t uint24_get_no (stringer_t *s)`
Fetch a 3 byte network order value from a stringer and return it in host byte order.
- `uint16_t uint16_get_no (stringer_t *s)`
Fetch a 2 byte network order value from a stringer and return it in host byte order.

5.58.1 Function Documentation

5.58.1.1 `bool_t double_conv (stringer_t * s, double_t * number)`

[numbers.c](#) [numbers.c](#)

Parameters:

- s* the managed string to be converted.
- number* a pointer to a double where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 48 of file numbers.c.

References `log_pedantic`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

5.58.1.2 `bool_t float_conv (stringer_t * s, float_t * number)`

Convert a managed string to a float.

Parameters:

- s* the managed string to be converted.
- number* a pointer to a float where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 16 of file numbers.c.

References `log_pedantic`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

5.58.1.3 `int16_t int16_clamp (int16_t min, int16_t max, int16_t number)`

[clamp.c](#) [clamp.c](#)

Parameters:

- min* minimum value for the clamp
- max* maximum value for the clamp
- number* number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 125 of file clamp.c.

References `log_pedantic`.

5.58.1.4 bool_t int16_conv_bl (void * *block*, size_t *length*, int16_t * *number*)

Convert a numerical string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 559 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int16(), int16_conv_ns(), and int16_conv_st().

5.58.1.5 bool_t int16_conv_ns (char * *string*, int16_t * *number*)

Convert a null-terminated string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 615 of file numbers.c.

References int16_conv_bl(), and ns_length_get().

5.58.1.6 bool_t int16_conv_st (stringer_t * *string*, int16_t * *number*)

Convert a managed string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 626 of file numbers.c.

References `int16_conv_bl()`, `st_data_get()`, and `st_length_get()`.

Referenced by `xml_get_xpath_int16()`.

5.58.1.7 `size_t int16_digits (int16_t number)`

[digits.c digits.c](#)

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 112 of file digits.c.

References `length`.

Referenced by `serialize_int16()`.

5.58.1.8 `int32_t int32_clamp (int32_t min, int32_t max, int32_t number)`

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 146 of file clamp.c.

References `log_pedantic`.

5.58.1.9 `bool_t int32_conv_bl (void * block, size_t length, int32_t * number)`

Convert a numerical string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 480 of file numbers.c.

References `data`, and `log_pedantic`.

Referenced by `deserialize_int32()`, `http_parse_header()`, `imap_fetch_parse_partial()`, `int32_conv_ns()`, and `int32_conv_st()`.

5.58.1.10 bool_t int32_conv_ns (char * *string*, int32_t * *number*)

Convert a null-terminated string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 536 of file numbers.c.

References int32_conv_bl(), and ns_length_get().

Referenced by process_find_pid(), and process_kill().

5.58.1.11 bool_t int32_conv_st (stringer_t * *string*, int32_t * *number*)

Convert a managed string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 547 of file numbers.c.

References int32_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int32().

5.58.1.12 size_t int32_digits (int32_t *number*)

Count the number of digits needed to represent a base-10 32-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 93 of file digits.c.

References length.

Referenced by serialize_int32().

5.58.1.13 `int64_t int64_clamp(int64_t min, int64_t max, int64_t number)`

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 167 of file clamp.c.

References log_pedantic.

5.58.1.14 `bool_t int64_conv_bl(void *block, size_t length, int64_t *number)`

Convert a numerical string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.
length the length, in bytes, of the numerical data.
number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 401 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int64(), int64_conv_ns(), int64_conv_st(), and ssize_conv_bl().

5.58.1.15 `bool_t int64_conv_ns(char *string, int64_t *number)`

Convert a null-terminated string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.
number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 457 of file numbers.c.

References int64_conv_bl(), and ns_length_get().

5.58.1.16 bool_t int64_conv_st (stringer_t * *string*, int64_t * *number*)

Convert a managed string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 468 of file numbers.c.

References int64_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int64().

5.58.1.17 size_t int64_digits (int64_t *number*)

Count the number of digits needed to represent a base-10 64-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 74 of file digits.c.

References length.

Referenced by serialize_int64().

5.58.1.18 int8_t int8_clamp (int8_t *min*, int8_t *max*, int8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 104 of file clamp.c.

References log_pedantic.

5.58.1.19 bool_t int8_conv_bl (void * *block*, size_t *length*, int8_t * *number*)

Convert a numerical string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 638 of file numbers.c.

References data, and log_pedantic.

Referenced by int8_conv_ns(), and int8_conv_st().

5.58.1.20 bool_t int8_conv_ns (char * *string*, int8_t * *number*)

Convert a null-terminated string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 694 of file numbers.c.

References int8_conv_bl(), and ns_length_get().

5.58.1.21 bool_t int8_conv_st (stringer_t * *string*, int8_t * *number*)

Convert a managed string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 705 of file numbers.c.

References `int8_conv_bl()`, `st_data_get()`, and `st_length_get()`.

Referenced by `cache_set_value()`, `config_value_set()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_int8()`.

5.58.1.22 `size_t int8_digits (int8_t number)`

Count the number of digits needed to represent a base-10 8-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 131 of file digits.c.

References `length`.

5.58.1.23 `bool_t size_conv_bl (void * block, size_t length, size_t * number)`

Convert a numerical string into a `size_t` value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an `size_t` value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 82 of file numbers.c.

References `uint64_conv_bl()`.

Referenced by `http_body()`.

5.58.1.24 `bool_t ssize_conv_bl (void * block, size_t length, ssize_t * number)`

Convert a numerical string into an `ssize_t` value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an `ssize_t` value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 94 of file numbers.c.

References `int64_conv_bl()`.

5.58.1.25 uint16_t uint16_clamp (uint16_t *min*, uint16_t *max*, uint16_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 41 of file clamp.c.

References log_pedantic.

5.58.1.26 bool_t uint16_conv_bl (void * *block*, size_t *length*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.
length the length, in bytes, of the numerical string.
number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 259 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint16(), uint16_conv_ns(), and uint16_conv_st().

5.58.1.27 bool_t uint16_conv_ns (char * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.
number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 307 of file numbers.c.

References ns_length_get(), and uint16_conv_bl().

5.58.1.28 bool_t uint16_conv_st (stringer_t * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 318 of file numbers.c.

References st_data_get(), st_length_get(), and uint16_conv_bl().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint16().

5.58.1.29 size_t uint16_digits (uint16_t *number*)

Count the number of digits needed to represent a base-10 16-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 44 of file digits.c.

References length.

Referenced by serialize_uint16().

5.58.1.30 uint16_t uint16_get_no (stringer_t * *s*)

Fetch a 2 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 2 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 852 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.58.1.31 stringer_t* uint16_put_no (uint16_t *val*)

Create a stringer, storing a 2-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 2 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 774 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.58.1.32 uint32_t uint24_get_no (stringer_t * s)

Fetch a 3 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 3 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 827 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.58.1.33 stringer_t* uint24_put_no (uint32_t val)

Create a stringer, storing a 3-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 3 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 745 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.58.1.34 uint32_t uint32_clamp (uint32_t min, uint32_t max, uint32_t number)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 62 of file clamp.c.

References log_pedantic.

5.58.1.35 bool_t uint32_conv_bl (void * *block*, size_t *length*, uint32_t * *number*)

Convert a numerical string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 188 of file numbers.c.

References data, and log_pedantic.

Referenced by cache_config(), deserialize_uint32(), relay_config(), servers_config(), uint32_conv_ns(), and uint32_conv_st().

5.58.1.36 bool_t uint32_conv_ns (char * *string*, uint32_t * *number*)

Convert a null-terminated string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 236 of file numbers.c.

References ns_length_get(), and uint32_conv_bl().

5.58.1.37 bool_t uint32_conv_st (stringer_t * *string*, uint32_t * *number*)

Convert a managed string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 247 of file numbers.c.

References `st_data_get()`, `st_length_get()`, and `uint32_conv_bl()`.

Referenced by `cache_set_value()`, `config_value_set()`, `imap_fetch_body_part()`, `imap_search_messages_date_compare()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_uint32()`.

5.58.1.38 `size_t uint32_digits (uint32_t number)`

Count the number of digits needed to represent a base-10 32-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 29 of file digits.c.

References `length`.

Referenced by `serialize_uint32()`.

5.58.1.39 `uint32_t uint32_get_no (stringer_t * s)`

Fetch a 4 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 4 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 801 of file numbers.c.

References `data`, `log_pedantic`, `st_data_get()`, `st_empty`, and `st_length_get()`.

5.58.1.40 `stringer_t* uint32_put_no (uint32_t val)`

Create a stringer, storing a 4-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 4 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 715 of file numbers.c.

References `data`, `log_pedantic`, `st_alloc()`, `st_data_get()`, and `st_length_set()`.

5.58.1.41 `uint64_t uint64_clamp (uint64_t min, uint64_t max, uint64_t number)`

Ensure a number is between the min and max values, otherwise return tuint_the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 83 of file clamp.c.

References log_pedantic.

Referenced by stacie_derive_rounds(), and stmt_exec_affected_conn().

5.58.1.42 **bool_t uint64_conv_bl** (void * *block*, size_t *length*, uint64_t * *number*)

Convert a numerical string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 106 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint64(), imap_parse_literal(), pop_num_parse(), pop_top_parse(), size_conv_bl(), smtp_check_receive_quota(), uint64_conv_ns(), uint64_conv_pl(), and uint64_conv_st().

5.58.1.43 **bool_t uint64_conv_ns** (char * *string*, uint64_t * *number*)

Convert a null-terminated string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 154 of file numbers.c.

References ns_length_get(), and uint64_conv_bl().

Referenced by json_api_dispatch(), lib_load_xml(), and portal_endpoint().

5.58.1.44 bool_t uint64_conv_pl (placer_t *string*, uint64_t * *number*)

Convert a placer into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the placer to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 176 of file numbers.c.

References pl_data_get(), pl_length_get(), and uint64_conv_bl().

Referenced by build_version_major(), build_version_minor(), build_version_patch(), smtp_parse_mail_from_path(), and stamp_counter_check().

5.58.1.45 bool_t uint64_conv_st (stringer_t * *string*, uint64_t * *number*)

Convert a managed string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 165 of file numbers.c.

References st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by cache_set_value(), config_value_set(), imap_narrow_messages(), imap_search_messages_range(), imap_search_messages_size(), portal_get_upload_attachment(), relay_set_value(), servers_set_value(), teacher_process(), and xml_get_xpath_uint64().

5.58.1.46 size_t uint64_digits (uint64_t *number*)

Count the number of digits needed to represent a base-10 64-bit unsigned integer.

Returns:

the number of digits needed to represent specified integer.

Definition at line 14 of file digits.c.

References length.

Referenced by mail_build_signature(), serialize_uint64(), sess_key(), and smtp_store_spamsig().

5.58.1.47 uint8_t uint8_clamp (uint8_t *min*, uint8_t *max*, uint8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 20 of file clamp.c.

References log_pedantic.

5.58.1.48 bool_t uint8_conv_bl (void * *block*, size_t *length*, uint8_t * *number*)

Convert a numerical string to an unsigned 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.
length the length, in bytes, of the numerical string.
number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 330 of file numbers.c.

References data, and log_pedantic.

Referenced by ip_subnet_st(), uint8_conv_ns(), and uint8_conv_st().

5.58.1.49 bool_t uint8_conv_ns (char * *string*, uint8_t * *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.
number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 378 of file numbers.c.

References ns_length_get(), and uint8_conv_bl().

5.58.1.50 `bool_t uint8_conv_st (stringer_t * string, uint8_t * number)`

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 389 of file numbers.c.

References `st_data_get()`, `st_length_get()`, and `uint8_conv_bl()`.

Referenced by `cache_set_value()`, `config_value_set()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_uint8()`.

5.58.1.51 `size_t uint8_digits (uint8_t number)`

Count the number of digits needed to represent a base-10 8-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 59 of file digits.c.

References `length`.

time.c
- [stringer_t * time_print_gmt](#) ([stringer_t](#) *s, [chr_t](#) *format, [time_t](#) moment)
Get a specified time as a formatted string converted to GMT.
- [stringer_t * time_print_local](#) ([stringer_t](#) *s, [chr_t](#) *format, [time_t](#) moment)
Get a specified time as a formatted string.
- [uint64_t time_till_midnight](#) (void)
Get the number of seconds until midnight.
- [uchr_t lower_chr](#) ([uchr_t](#) c)
Return the lowercase representation of a character.
- [stringer_t * lower_st](#) ([stringer_t](#) *s)
Transform a managed string (in-place) into lowercase.
- [uchr_t upper_chr](#) ([uchr_t](#) c)
Return the uppercase representation of a character.
- [stringer_t * upper_st](#) ([stringer_t](#) *s)
Transform a managed string (in-place) into uppercase.
- [uint64_t tok_get_count_st](#) ([stringer_t](#) *string, char token)
Count the number of times a token is found in a managed string.
- [uint64_t tok_get_count_bl](#) (void *block, [size_t](#) length, char token)
Count the number of times a token is found in a specified block of memory.
- [uint64_t str_tok_get_count_bl](#) (void *block, [size_t](#) length, [chr_t](#) *token, [size_t](#) toklen)
Count the number of times a string token is found in a specified block of memory.
- [int tok_get_pl](#) ([placer_t](#) string, char token, [uint64_t](#) fragment, [placer_t](#) *value)
Retrieve a specified token from a placer.
- [int tok_get_st](#) ([stringer_t](#) *string, char token, [uint64_t](#) fragment, [placer_t](#) *value)
Retrieve a specified token from a managed string.

- `int tok_get_bl` (void *block, size_t length, char token, uint64_t fragment, `placer_t` *value)
Retrieve a specified token from a block of data.
- `int tok_get_ns` (char *string, size_t length, char token, uint64_t fragment, `placer_t` *value)
Retrieve a specified token from a null-terminated string.
- `int str_tok_get_bl` (char *block, size_t length, `chr_t` *token, size_t toklen, uint64_t fragment, `placer_t` *value)
Retrieve a specified string-split token from a null-terminated string.
- `int tok_pop` (`tok_state_t` *state, `placer_t` *value)
- `void tok_pop_init_st` (`tok_state_t` *state, `stringer_t` *string, char token)

- `bool_t pl_skip_characters` (`placer_t` *place, char *skipchars, size_t nchars)
Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.
- `bool_t pl_skip_to_characters` (`placer_t` *place, char *skiptochars, size_t nchars)
Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.
- `bool_t pl_shrink_before_characters` (`placer_t` *place, char *shrinkchars, size_t nchars)
Truncate a placer to start before any of the specified characters, and update the placer accordingly.
- `bool_t pl_get_embraced` (`placer_t` str, `placer_t` *out, unsigned char opening, unsigned char closing, `bool_t` required)
Get a placer pointing to the text contained within a specified pair of opening and closing braces.
- `bool_t pl_update_start` (`placer_t` *place, size_t nchars, `bool_t` more)
Ensure that a placer contains at least a certain amount of data, and update it accordingly.
- `placer_t line_pl_ns` (char *string, uint64_t number)
Get a placer pointing to the specified line (' delimited) of a null-terminated string.
- `placer_t line_pl_pl` (`placer_t` string, uint64_t number)
Get a placer pointing to the specified line (' delimited) of another placer.
- `placer_t line_pl_st` (`stringer_t` *string, uint64_t number)
Get a placer pointing to the specified line (' delimited) of a managed string.
- `placer_t line_pl_bl` (char *block, size_t length, uint64_t number)
Get a placer pointing to the specified line (' delimited) of content in a data buffer.
- `placer_t pl_trim` (`placer_t` place)
trim.c
- `placer_t pl_trim_end` (`placer_t` place)
- `placer_t pl_trim_start` (`placer_t` place)
Trim the leading whitespace from a placer.
- `void st_trim` (`stringer_t` *string)
- `stringer_t * st_xor` (`stringer_t` *a, `stringer_t` *b, `stringer_t` *outcome)
bitwise.c

- [stringer_t * st_and](#) ([stringer_t *a](#), [stringer_t *b](#), [stringer_t *outcome](#))

Perform bitwise AND operation between two input strings.

- [stringer_t * st_or](#) ([stringer_t *a](#), [stringer_t *b](#), [stringer_t *outcome](#))

Perform bitwise OR operation between two input strings.

- [stringer_t * st_not](#) ([stringer_t *s](#), [stringer_t *outcome](#))

Perform bitwise NOT operation on a managed string.

5.59.1 Function Documentation

5.59.1.1 [placer_t line_pl_bl](#) ([char * block](#), [size_t length](#), [uint64_t number](#))

Get a placer pointing to the specified line (‘
’ delimited) of content in a data buffer.

Parameters:

- block*** a pointer to the block of data to be scanned.
- length*** the length, in bytes, of the specified data buffer.
- number*** the zero-based index of the line to be retrieved from the buffer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 17 of file line.c.

References [log_pedantic](#), [mm_empty\(\)](#), [pl_init\(\)](#), and [pl_null\(\)](#).

Referenced by [line_pl_ns\(\)](#), [line_pl_pl\(\)](#), and [line_pl_st\(\)](#).

5.59.1.2 [placer_t line_pl_ns](#) ([char * string](#), [uint64_t number](#))

Get a placer pointing to the specified line (‘
’ delimited) of a null-terminated string.

See also:

[line_pl_bl\(\)](#)

Parameters:

- string*** a pointer to a null-terminated string to be scanned.
- number*** the zero-based index of the line to be retrieved from the string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 60 of file line.c.

References [line_pl_bl\(\)](#), and [ns_length_get\(\)](#).

5.59.1.3 `placer_t line_pl_pl (placer_t string, uint64_t number)`

Get a placer pointing to the specified line (‘
’ delimited) of another placer.

Parameters:

string a pointer to the placer to be scanned.
number the zero-based index of the line to be retrieved from the placer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 82 of file line.c.

References `line_pl_bl()`, `pl_char_get()`, and `pl_length_get()`.

5.59.1.4 `placer_t line_pl_st (stringer_t * string, uint64_t number)`

Get a placer pointing to the specified line (‘
’ delimited) of a managed string.

Parameters:

string a pointer to the managed string to be scanned.
number the zero-based index of the line to be retrieved from the managed string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 71 of file line.c.

References `line_pl_bl()`, `st_char_get()`, and `st_length_get()`.

Referenced by `client_read_line()`, `con_read_line()`, and `imap_parse_literal()`.

5.59.1.5 `uchr_t lower_chr (uchr_t c)`

Return the lowercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in lowercase.

Definition at line 25 of file case.c.

Referenced by `auth_sanitize_address()`, `hex_decode_chr()`, `mm_cmp_ci_eq()`, `pop_user_parse()`, `smtp_parse_helo_domain()`, `smtp_parse_mail_from_path()`, `smtp_parse_rcpt_to()`, `st_cmp_ci_ends()`, `st_cmp_ci_eq()`, `st_cmp_ci_starts()`, and `st_search_ci()`.

5.59.1.6 stringer_t* lower_st (stringer_t * s)

Transform a managed string (in-place) into lowercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in lowercase.

Definition at line 58 of file case.c.

References log_pedantic, and st_empty_out().

Referenced by contact_business_valid_email(), http_parse_header(), register_business_step1(), and smtp_rcpt_to().

5.59.1.7 bool_t pl_get_embraced (placer_t str, placer_t * out, unsigned char opening, unsigned char closing, bool_t required)

Get a placer pointing to the text contained within a specified pair of opening and closing braces.

Parameters:

str a placer pointing to the string to be parsed.

out a pointer to a placer that will store the string between the braces on success.

opening the character to be the opening brace of the sequence.

closing the character to be the closing brace of the sequence.

required if true, fail if no data was found between the pair of braces.

Returns:

true if the brace sequence was complete, or false if either component could not be located.

Definition at line 442 of file token.c.

References pl_char_get(), and pl_empty().

5.59.1.8 bool_t pl_shrink_before_characters (placer_t * place, char * shrinkchars, size_t nchars)

Truncate a placer to start before any of the specified characters, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to be truncated before any of the specified characters.

shrinkchars a pointer to a buffer containing bytes that will be skipped when they are found at the end of the placer.

nchars the number of characters to be tested in the collection in shrinkchars.

Returns:

true if the shrink operation completed before the end of the placer was reached, or false otherwise.

Definition at line 405 of file token.c.

References pl_char_get(), pl_empty(), and pl_length_get().

Referenced by portal_upload().

5.59.1.9 `bool_t pl_skip_characters (placer_t * place, char * skipchars, size_t nchars)`

Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip past any of the specified characters.

skipchars a pointer to a buffer containing bytes that will be skipped at the beginning of the placer.

nchars the number of characters to be tested in the collection in skipchars.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 336 of file token.c.

References `pl_char_get()`, and `pl_empty()`.

Referenced by `portal_upload()`.

5.59.1.10 `bool_t pl_skip_to_characters (placer_t * place, char * skiptochars, size_t nchars)`

Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip to any of the specified characters.

skiptochars a pointer to a buffer containing bytes that will be skipped to when they are first found in the placer.

nchars the number of characters to be tested in the collection in skiptochars.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 372 of file token.c.

References `pl_char_get()`, and `pl_empty()`.

Referenced by `portal_upload()`.

5.59.1.11 `placer_t pl_trim (placer_t place)`

[trim.c](#)

Definition at line 42 of file trim.c.

References `pl_char_get()`, `pl_init()`, `pl_length_get()`, and `pl_null()`.

Referenced by `nvp_parse()`, `prime_pem_unwrap()`, and `smtp_parse_mail_from_path()`.

5.59.1.12 `placer_t pl_trim_end (placer_t place)`

Definition at line 84 of file trim.c.

References `pl_char_get()`, `pl_init()`, `pl_length_get()`, and `pl_null()`.

Referenced by `smtp_parse_helo_domain()`, `smtp_parse_mail_from_path()`, and `smtp_parse_rcpt_to()`.

5.59.1.13 `placer_t pl_trim_start (placer_t place)`

Trim the leading whitespace from a placer.

Parameters:

place a placer containing the string to have its leading whitespace trimmed.

Returns:

a placer pointing to the trimmed value inside the originally specified input string.

Definition at line 67 of file trim.c.

References `pl_char_get()`, `pl_init()`, `pl_length_get()`, and `pl_null()`.

Referenced by `get_header_opt()`.

5.59.1.14 `bool_t pl_update_start (placer_t * place, size_t nchars, bool_t more)`

Ensure that a placer contains at least a certain amount of data, and update it accordingly.

Parameters:

place a pointer to the placer containing the original data, which will be updated on success.

nchars the minimum number of characters that the placer needs to contain to pass the test.

more if true, more characters following the minimum buffer size are necessary.

Returns:

true if the placer meets the minimum size check, or false if it does not.

Definition at line 485 of file token.c.

5.59.1.15 `stringer_t* st_and (stringer_t * a, stringer_t * b, stringer_t * output)`

Perform bitwise AND operation between two input strings.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (`output = NULL`) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 149 of file bitwise.c.

References `bitwise_and()`, and `st_bitwise()`.

5.59.1.16 `stringer_t* st_not (stringer_t * s, stringer_t * output)`

Perform bitwise NOT operation on a managed string.

Parameters:

s Stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 75 of file bitwise.c.

References data, log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), and st_valid_destination().

5.59.1.17 stringer_t* st_or (stringer_t * *a*, stringer_t * *b*, stringer_t * *output*)

Perform bitwise OR operation between two input strings.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 123 of file bitwise.c.

References bitwise_or(), and st_bitwise().

5.59.1.18 void st_trim (stringer_t * *string*)

Definition at line 15 of file trim.c.

References mm_move(), mm_wipe(), st_avail_get(), st_char_get(), st_length_get(), and st_length_set().

Referenced by mail_header_fetch_cleaned(), and process_find_pid().

5.59.1.19 stringer_t* st_xor (stringer_t * *a*, stringer_t * *b*, stringer_t * *output*)

bitwise.c bitwise.c

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 136 of file bitwise.c.

References `bitwise_xor()`, and `st_bitwise()`.

5.59.1.20 `int str_tok_get_bl(char *block, size_t length, chr_t *token, size_t toklen, uint64_t fragment, placer_t *value)`

Retrieve a specified string-split token from a null-terminated string.

Parameters:

block a pointer to the block of memory to be tokenized.

length the maximum number of characters to be scanned from the input data.

token the token string that will be used to split the data.

toklen the length, in bytes, of the token string.

fragment the zero-indexed token number to be extracted from the data.

value a pointer to a placer that will receive the value of the extracted token on success, or `pl_null()` on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 290 of file token.c.

References `mm_empty()`, `pl_char_get()`, `pl_init()`, `pl_length_get()`, `pl_null()`, `placer_t`, and `st_search_cs()`.

Referenced by `portal_upload()`.

5.59.1.21 `uint64_t str_tok_get_count_bl(void *block, size_t length, chr_t *token, size_t toklen)`

Count the number of times a string token is found in a specified block of memory.

Parameters:

block a pointer to a block of memory to be scanned.

length the length, in bytes, of the block of memory to be scanned.

token a pointer to the string token being used to split the input data.

toklen the length, in bytes, of the specified token.

Returns:

the number of times the string token was found in the block of memory, or 0 on failure.

Definition at line 257 of file token.c.

References `count`, `mm_empty()`, `pl_init()`, `pl_length_get()`, `placer_t`, and `st_search_cs()`.

Referenced by `portal_upload()`.

5.59.1.22 `uint64_t time_datestamp(void)`

[time.c](#) [time.c](#)

Returns:

0 on failure or a 64-bit unsigned integer containing the formatted current date on success.

Definition at line 36 of file time.c.

Referenced by api_endpoint_auth(), imap_login(), log_rotate(), log_start(), pattern_update(), pop_pass(), portal_endpoint_auth(), process_maint(), smtp_auth_login(), and smtp_auth_plain().

5.59.1.23 stringer_t* time_print_gmt (stringer_t * s, chr_t * format, time_t moment)

Get a specified time as a formatted string converted to GMT.

Parameters:

- s* a managed string where the formatted time is to be stored.
- format* a null-terminated string containing the format of the time string.
- moment* the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 92 of file time.c.

References log_pedantic, mm_wipe(), st_avail_get(), st_char_get(), and st_length_set().

Referenced by http_response_cookie(), http_response_header(), and http_response_options().

5.59.1.24 stringer_t* time_print_local (stringer_t * s, chr_t * format, time_t moment)

Get a specified time as a formatted string.

Parameters:

- s* a managed string where the formatted time is to be stored.
- format* a null-terminated string containing the format of the time string.
- moment* the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 61 of file time.c.

References log_pedantic, mm_wipe(), st_avail_get(), st_char_get(), and st_length_set().

Referenced by imap_id(), and register_data_insert_user().

5.59.1.25 uint64_t time_till_midnight (void)

Get the number of seconds until midnight.

Returns:

an unsigned 64-bit integer containing the number of seconds until midnight, or 86400 on failure.

Definition at line 14 of file time.c.

Referenced by process_maint().

5.59.1.26 `int tok_get_bl (void * block, size_t length, char token, uint64_t fragment, placer_t * value)`

Retrieve a specified token from a block of data.

See also:

[tok_get_ns\(\)](#)

Parameters:

block a pointer to the memory block to be tokenized.

length the maximum number of characters to be scanned at the input data block.

token the token character that will be used to split the data block.

fragment the zero-indexed token number to be extracted from the data block.

value a pointer to a placer that will receive the value of the extracted token on success, or [pl_null\(\)](#) on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the data block.

Definition at line 128 of file token.c.

References [tok_get_ns\(\)](#).

Referenced by [nvp_parse\(\)](#), [smtp_parse_mail_from_path\(\)](#), [tok_get_pl\(\)](#), and [tok_get_st\(\)](#).

5.59.1.27 `uint64_t tok_get_count_bl (void * block, size_t length, char token)`

Count the number of times a token is found in a specified block of memory.

Parameters:

block a pointer to a block of memory to be scanned.

length the length, in bytes, of the block of memory to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the block of memory, or 0 on failure.

Definition at line 17 of file token.c.

References [count](#), [log_pedantic](#), and [mm_empty\(\)](#).

Referenced by [smtp_parse_mail_from_path\(\)](#), and [tok_get_count_st\(\)](#).

5.59.1.28 `uint64_t tok_get_count_st (stringer_t * string, char token)`

Count the number of times a token is found in a managed string.

See also:

[tok_get_count_bl\(\)](#)

Parameters:

string a pointer to the managed string to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the managed string, or 0 on failure.

Definition at line 49 of file token.c.

References `st_data_get()`, `st_length_get()`, and `tok_get_count_bl()`.

Referenced by `get_header_opt()`, `get_header_value_noopt()`, `http_parse_method()`, `http_parse_pairs()`, `imap_fetch_body_part()`, `imap_narrow_messages()`, `imap_search_messages_date()`, `imap_search_messages_date_compare()`, `imap_search_messages_range()`, `ip_subnet_st()`, `mail_domain_get()`, `mail_mime_type_parameters()`, `portal_get_upload_attachment()`, and `stamp_counter_check()`.

5.59.1.29 int tok_get_ns (char * string, size_t length, char token, uint64_t fragment, placer_t * value)

Retrieve a specified token from a null-terminated string.

Parameters:

string a pointer to the null-terminated string to be tokenized.

length the maximum number of characters to be scanned from the input string.

token the token character that will be used to split the string.

fragment the zero-indexed token number to be extracted from the string.

value a pointer to a placer that will receive the value of the extracted token on success, or `pl_null()` on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 63 of file token.c.

References `log_pedantic`, `mm_empty()`, `pl_init()`, and `pl_null()`.

Referenced by `ip_subnet_st()`, `lib_load_openssl()`, and `tok_get_bl()`.

5.59.1.30 int tok_get_pl (placer_t string, char token, uint64_t fragment, placer_t * value)

Retrieve a specified token from a placer.

See also:

`token_get_ns()`

Parameters:

string a pointer to the placer to be tokenized.

token the token character that will be used to split the placer.

fragment the zero-indexed token number to be extracted from the placer.

value a pointer to a placer that will receive the value of the extracted token on success, or `pl_null()` on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the placer.

Definition at line 156 of file token.c.

References `pl_data_get()`, `pl_length_get()`, and `tok_get_bl()`.

Referenced by `http_data_value_parse()`, `http_parse_context()`, `http_parse_method()`, and `smtp_parse_mail_from_path()`.

5.59.1.31 `int tok_get_st (stringer_t * string, char token, uint64_t fragment, placer_t * value)`

Retrieve a specified token from a managed string.

See also:

[tok_get_ns\(\)](#)

Parameters:

string a pointer to the managed string to be tokenized.

token the token character that will be used to split the managed string.

fragment the zero-indexed token number to be extracted from the managed string.

value a pointer to a placer that will receive the value of the extracted token on success, or [pl_null\(\)](#) on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the managed string.

Definition at line 142 of file token.c.

References [st_data_get\(\)](#), [st_length_get\(\)](#), and [tok_get_bl\(\)](#).

5.59.1.32 `int tok_pop (tok_state_t * state, placer_t * value)`

on error the function returns -1 and sets value to EMPTY_PLACER on success the function returns 0 and stores the token in the placer pointed at by value if the end is hit, then the function returns 1, and places any remaining data in value

Definition at line 188 of file token.c.

References [pl_init\(\)](#), [pl_null\(\)](#), [tok_state_t::position](#), [tok_state_t::remaining](#), and [tok_state_t::token](#).

Referenced by [nvp_parse\(\)](#), and [prime_pem_unwrap\(\)](#).

5.59.1.33 `void tok_pop_init_bl (tok_state_t * state, void * block, size_t length, char token)`

Definition at line 161 of file token.c.

References [tok_state_t::block](#), [tok_state_t::length](#), [tok_state_t::position](#), [tok_state_t::remaining](#), and [tok_state_t::token](#).

5.59.1.34 `void tok_pop_init_st (tok_state_t * state, stringer_t * string, char token)`

Definition at line 172 of file token.c.

References [tok_state_t::block](#), [tok_state_t::length](#), [tok_state_t::position](#), [tok_state_t::remaining](#), [st_char_get\(\)](#), [st_length_get\(\)](#), and [tok_state_t::token](#).

Referenced by [nvp_parse\(\)](#), and [prime_pem_unwrap\(\)](#).

5.59.1.35 `uchar_t upper_chr (uchar_t c)`

Return the uppercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in uppercase.

Definition at line 15 of file case.c.

5.59.1.36 stringer_t* upper_st (stringer_t * s)

Transform a managed string (in-place) into uppercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in uppercase.

Definition at line 35 of file case.c.

References `log_pedantic`, and `st_empty_out()`.

Referenced by `http_response_allow_cross()`, `imap_fetch_body_tag()`, `imap_fetch_bodystructure()`, and `mail_mime_type_parameters()`.

5.60 src/providers/parsers/parsers.h File Reference

Functions

- [bool_t lib_load_jansson](#) (void)
json.c
- [chr_t * lib_version_jansson](#) (void)
Return the version string for libjansson.
- [bool_t lib_load_xml](#) (void)
xml.c
- [bool_t xml_start](#) (void)
Initialize the xml parser library.
- [chr_t * xml_get_xpath_ns](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the content of an evaluated xpath expression as a null-terminated string.
- [const chr_t * lib_version_xml](#) (void)
Return the version string of libxml.
- [int16_t xml_get_xpath_int16](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as a signed 16-bit integer.
- [int32_t xml_get_xpath_int32](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as a signed 32-bit integer.
- [int64_t xml_get_xpath_int64](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as a signed 64-bit integer.
- [int8_t xml_get_xpath_int8](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as a signed 8-bit integer.
- [int_t xml_xpath_set_namespace](#) (xmlXPathContextPtr ctxt, xmlChar *prefix, xmlChar *ns_uri)
Set the namespace for an xpath context.
- [size_t xml_get_xpath_node_count](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
This function is not currently being called by any other part of the code.
- [stringer_t * xml_dump_doc](#) (xmlDocPtr doc)
Get an xml document object as a string.
- [stringer_t * xml_get_xpath_st](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as a managed string.
- [stringer_t * xml_node_get_content_st](#) (xmlNodePtr node)
Get the content of an xml node as a managed string.
- [uint16_t xml_get_xpath_uint16](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as an unsigned 16-bit integer.
- [uint32_t xml_get_xpath_uint32](#) (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 32-bit integer.

- `uint64_t xml_get_xpath_uint64` (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as an unsigned 64-bit integer.
- `uint8_t xml_get_xpath_uint8` (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
Get the value of a node element or attribute selected by an xpath expression as an unsigned 8-bit integer.
- `bool_t xml_set_xpath_uint64` (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uint64_t val)
Set the value of a node element selected by an xpath expression, as a 64-bit unsigned integer.
- `bool_t xml_set_xpath_ns` (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, `uchr_t` *val)
Set the value of a node element selected by an xpath expression, as a null-terminated string.
- `bool_t xml_set_xpath_property` (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, `uchr_t` *name, `uchr_t` *val)
Set the value of a specified property of a node element selected by an xpath expression.
- `void xml_error` (void *ctx, const `chr_t` *format,...)
A function handler for displaying xml parser error messages to the user.
- `void xml_free_doc` (xmlDocPtr doc)
Free an xml document.
- `void xml_free_parser_ctx` (xmlParserCtxtPtr ctx)
Destroy an xml parser context.
- `void xml_free_xpath_ctx` (xmlXPathContextPtr ctx)
Free an xml xpath context.
- `void xml_free_xpath_obj` (xmlXPathObjectPtr obj)
Free an xml xpath object.
- `void xml_node_free` (xmlNodePtr node)
Free an xml node.
- `void xml_node_set_content` (xmlNodePtr node, `uchr_t` *content)
Set the content of an xml node.
- `void xml_stop` (void)
Cleanup the state and allocated memory of the xml parser in preparation to be shutdown.
- `xmlAttrPtr xml_node_set_property` (xmlNodePtr node, `uchr_t` *name, `uchr_t` *value)
Set an attribute of an xml node.
- `xmlChar * xml_encode` (xmlDocPtr doc, `stringer_t` *string)
Encode an xml string, performing proper replacement of defined entities and non-ASCII values.
- `xmlDocPtr xml_create_doc` (xmlParserCtxtPtr ctx, const `chr_t` *buffer, `int_t` size, const `chr_t` *url, const `chr_t` *encoding, `int_t` options)
Create a new xml document object from specified user data.
- `xmlNodePtr xml_node_add_sibling` (xmlNodePtr current, xmlNodePtr element)
Add an xml node to the list of siblings of another xml node.

- xmlNodePtr [xml_node_new](#) (uchar_t *name)
Create an xml node.
- xmlParserCtxtPtr [xml_create_parser_ctx](#) (void)
Create and initialize a new xml parser context.
- xmlXPathContextPtr [xml_create_xpath_ctx](#) (xmlDocPtr doc)
Create an xpath context for an xml document.
- xmlXPathObjectPtr [xml_xpath_eval](#) (const uchar_t *xpath, xmlXPathContextPtr ctx)
Evaluate an xml xpath expression.
- bool_t [lib_load_utf8proc](#) (void)
utf.c
- chr_t * [lib_version_utf8proc](#) (void)
Return the shared library version string for libutf8proc.
- bool_t [utf8_valid_st](#) (stringer_t *s)
Determine whether a managed string is a properly formatted UTF8 string.
- size_t [utf8_length_st](#) (stringer_t *s)
Determine how many valid Unicode characters the string has.
- const chr_t * [utf8_error_string](#) (ssize_t error_code)
Exchange an error code for a string explaining the nature of the UTF8 error.

5.60.1 Function Documentation

5.60.1.1 bool_t lib_load_jansson (void)

[json.c](#) [json.c](#)

Returns:

true on success or false on failure.

Definition at line 22 of file [json.c](#).

References [lib_symbols\(\)](#), [M_BIND](#), and [symbol_t](#).

Referenced by [lib_load\(\)](#).

5.60.1.2 bool_t lib_load_utf8proc (void)

[utf.c](#) [utf.c](#)

Returns:

true on success or false on failure.

Definition at line 23 of file [utf8.c](#).

References [lib_symbols\(\)](#), [M_BIND](#), and [symbol_t](#).

Referenced by [lib_load\(\)](#).

5.60.1.3 `bool_t lib_load_xml (void)`

[xml.c](#) [xml.c](#)

Returns:

true on success or false on failure.

Definition at line 26 of file `xml.c`.

References `lib_symbols()`, `M_BIND`, `symbol_t`, `uint64_conv_ns()`, `xml_version_string`, and `xmlParserVersion_d`.

Referenced by `lib_load()`.

5.60.1.4 `chr_t* lib_version_jansson (void)`

Return the version string for libjansson.

Returns:

a pointer to a character string containing the libjansson version information.

Definition at line 14 of file `json.c`.

References `jansson_version_d`.

Referenced by `lib_load()`.

5.60.1.5 `chr_t* lib_version_utf8proc (void)`

Return the shared library version string for libutf8proc.

Returns:

a pointer to a character string containing the libutf8proc version information.

Definition at line 15 of file `utf8.c`.

References `utf8proc_version_d`.

Referenced by `lib_load()`.

5.60.1.6 `const chr_t* lib_version_xml (void)`

Return the version string of libxml.

Returns:

a pointer to a character string containing the libxml version information.

Definition at line 17 of file `xml.c`.

References `xml_version_string`.

Referenced by `lib_load()`.

5.60.1.7 `const chr_t* utf8_error_string (ssize_t error_code)`

Exchange an error code for a string explaining the nature of the UTF8 error.

Parameters:

error_code the numeric error returned by the internal UTF8 mapping logic.

Returns:

A string constant with the error message. If the code goes unrecognized, then a generic message is returned.

Definition at line 42 of file utf8.c.

References utf8proc_errmsg_d.

Referenced by utf8_length_st().

5.60.1.8 size_t utf8_length_st (stringer_t * s)

Determine how many valid Unicode characters the string has.

Parameters:

s the managed string to be tested.

Returns:

The number of codepoints found if the string is valid, otherwise 0.

Definition at line 51 of file utf8.c.

References bytes, log_pedantic, st_empty_out(), utf8_error_string(), utf8proc_get_property_d, and utf8proc_iterate_d.

Referenced by auth_login(), register_business_validate_password(), register_data_insert_user(), and stacie_derive_rounds().

5.60.1.9 bool_t utf8_valid_st (stringer_t * s)

Determine whether a managed string is a properly formatted UTF8 string.

Parameters:

s the managed string to be tested.

Returns:

Valid strings return true, while invalid strings return false.

Definition at line 90 of file utf8.c.

References bytes, log_pedantic, st_empty_out(), and utf8proc_iterate_d.

5.60.1.10 xmlDocPtr xml_create_doc (xmlParserCtxtPtr ctx, const chr_t * buffer, int_t size, const chr_t * url, const chr_t * encoding, int_t options)

Create a new xml document object from specified user data.

See also:

xmlCtxtReadMemory()

Parameters:

ctx a pointer to the xml context to be used for the parsing operation.

buffer a null-terminated string containing the xml data to be parsed.

size the length, in bytes, of the xml data buffer to be parsed.

url a null-terminated string containing the base url to be used for the document.

encoding a null-terminated string specifying the document encoding type, or NULL for default.

options a value containing a mask of xml parser options of type xmlParserOption.

Returns:

NULL on failure, or a pointer to the xml document tree of the parsed xml text on success.

Definition at line 1051 of file xml.c.

References log_pedantic, and xmlCtxtReadMemory_d.

Referenced by http_page_get().

5.60.1.11 xmlParserCtxtPtr xml_create_parser_ctx (void)

Create and initialize a new xml parser context.

Returns:

NULL on failure, or a newly initialized xml parser context on success.

Definition at line 961 of file xml.c.

References log_pedantic, xml_error(), and xmlNewParserCtxt_d.

Referenced by http_page_get().

5.60.1.12 xmlXPathContextPtr xml_create_xpath_ctx (xmlDocPtr doc)

Create an xpath context for an xml document.

Parameters:

doc a pointer to the input xml document object.

Returns:

NULL on failure, or a pointer to the new xpath context on success.

Definition at line 917 of file xml.c.

References log_pedantic, and xmlXPathNewContext_d.

Referenced by http_page_get().

5.60.1.13 stringer_t* xml_dump_doc (xmlDocPtr doc)

Get an xml document object as a string.

Parameters:

doc a pointer to the xml document object to be serialized.

Returns:

NULL on failure or a pointer to a managed string containing the specified xml document's serialized data on success.

Definition at line 1018 of file xml.c.

References mm_free(), st_import(), and xmlDocDumpFormatMemory_d.

Referenced by contact_print_form(), contact_print_message(), portal_print_login(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.60.1.14 xmlChar* xml_encode (xmlDocPtr *doc*, stringer_t * *string*)

Encode an xml string, performing proper replacement of defined entities and non-ASCII values.

Parameters:

doc a pointer to the xml document containing the DTD to be used for the encoding process.

string a managed string containing the xml data to be encoded.

NULL on failure, or a newly allocated null-terminated string containing the encoded xml data on success.

Definition at line 69 of file xml.c.

References st_data_get(), and xmlEncodeEntitiesReentrant_d.

Referenced by contact_print_form().

5.60.1.15 void xml_error (void * *ctx*, const chr_t * *format*, ...)

A function handler for displaying xml parser error messages to the user.

Parameters:

ctx a placeholder; ignored.

format a null-terminated string containing a format string for the error message to be displayed.

... a variable argument list containing the parameters to the format string.

Returns:

This function returns no value.

Definition at line 854 of file xml.c.

References log_internal(), M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, and M_LOG_TIME_DISABLE.

Referenced by xml_create_parser_ctx().

5.60.1.16 void xml_free_doc (xmlDocPtr *doc*)

Free an xml document.

Parameters:

doc a pointer to the xml document to be freed.

Returns:

This function returns no value.

Definition at line 1001 of file xml.c.

References log_pedantic, and xmlFreeDoc_d.

Referenced by http_page_free().

5.60.1.17 void xml_free_parser_ctx (xmlParserCtxtPtr *ctx*)

Destroy an xml parser context.

Parameters:

ctx a pointer to the xml parser context to be freed.

Returns:

This function returns no value.

Definition at line 984 of file xml.c.

References log_pedantic, and xmlFreeParserCtxt_d.

Referenced by http_page_free().

5.60.1.18 void xml_free_xpath_ctx (xmlXPathContextPtr *ctx*)

Free an xml xpath context.

Parameters:

ctx a pointer to the xml xpath context to be freed.

Returns:

This function returns no value.

Definition at line 883 of file xml.c.

References log_pedantic, and xmlXPathFreeContext_d.

Referenced by http_page_free().

5.60.1.19 void xml_free_xpath_obj (xmlXPathObjectPtr *obj*)

Free an xml xpath object.

Parameters:

obj a pointer to the xml xpath object to be freed.

Returns:

This function returns no value.

Definition at line 900 of file xml.c.

References log_pedantic, and xmlXPathFreeObject_d.

Referenced by xml_set_xpath_ns(), xml_set_xpath_property(), and xml_set_xpath_uint64().

5.60.1.20 int16_t xml_get_xpath_int16 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 16-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 16-bit integer.

Definition at line 503 of file xml.c.

References `int16_conv_st()`, `log_pedantic`, `ns_length_get()`, `PLACER`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.21 int32_t xml_get_xpath_int32 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 32-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 32-bit integer.

Definition at line 448 of file xml.c.

References `int32_conv_st()`, `log_pedantic`, `ns_length_get()`, `PLACER`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.22 int64_t xml_get_xpath_int64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 64-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 64-bit integer.

Definition at line 393 of file xml.c.

References `int64_conv_st()`, `log_pedantic`, `ns_length_get()`, `PLACER`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.23 int8_t xml_get_xpath_int8 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 8-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 8-bit integer.

Definition at line 558 of file xml.c.

References `int8_conv_st()`, `log_pedantic`, `ns_length_get()`, `PLACER`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.24 `size_t xml_get_xpath_node_count (xmlXPathContextPtr xpath_ctx, xmlChar * xpath_query)`

This function is not currently being called by any other part of the code.

Definition at line 817 of file xml.c.

References `log_pedantic`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.25 `chr_t* xml_get_xpath_ns (xmlXPathContextPtr xpath_ctx, xmlChar * xpath_query)`

Get the content of an evaluated xpath expression as a null-terminated string.

Parameters:

ctx a pointer to the xpath context to be used for the evaluation.

xpath_query a null-terminated string containing the xpath expression to be evaluated.

Returns:

NULL on failure, or a null-terminated string containing the value of the xpath expression's specified node on success.

Definition at line 766 of file xml.c.

References `log_pedantic`, `ns_dupe()`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.26 `stringer_t* xml_get_xpath_st (xmlXPathContextPtr xpath_ctx, xmlChar * xpath_query)`

Get the value of a node element or attribute selected by an xpath expression as a managed string.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a managed string.

Definition at line 613 of file xml.c.

References `log_pedantic`, `ns_length_get()`, `st_import()`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.27 `uint16_t xml_get_xpath_uint16 (xmlXPathContextPtr xpath_ctx, xmlChar * xpath_query)`

Get the value of a node element or attribute selected by an xpath expression as an unsigned 16-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 16-bit integer.

Definition at line 283 of file xml.c.

References `log_pedantic`, `ns_length_get()`, `PLACER`, `uint16_conv_st()`, `xmlXPathEvalExpression_d`, and `xmlXPathFreeObject_d`.

5.60.1.28 uint32_t xml_get_xpath_uint32 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 32-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 32-bit integer.

Definition at line 229 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint32_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.60.1.29 uint64_t xml_get_xpath_uint64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 64-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 64-bit integer.

Definition at line 174 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint64_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.60.1.30 uint8_t xml_get_xpath_uint8 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 8-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 8-bit integer.

Definition at line 338 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint8_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.60.1.31 xmlNodePtr xml_node_add_sibling (xmlNodePtr *current*, xmlNodePtr *element*)

Add an xml node to the list of siblings of another xml node.

Note:

If the sibling node was already inserted into a document it will first be unlinked.

Parameters:

current a pointer to the xml node to which the sibling node will be added.

element a pointer to the sibling node to be added to the target node.

Returns:

NULL on failure, or a pointer to the sibling node on success.

Definition at line 94 of file xml.c.

References xmlAddSibling_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.60.1.32 void xml_node_free (xmlNodePtr node)

Free an xml node.

Parameters:

node a pointer to the xml node to be freed.

Returns:

This function returns no value.

Definition at line 57 of file xml.c.

References xmlFreeNode_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.60.1.33 stringer_t* xml_node_get_content_st (xmlNodePtr node)

Get the content of an xml node as a managed string.

Parameters:

node a pointer to the xml node to be queried.

Returns:

NULL on failure, or a pointer to a managed string

Definition at line 114 of file xml.c.

References log_pedantic, st_import(), xmlBufferContent_d, xmlBufferCreate_d, xmlBufferFree_d, xmlBufferLength_d, and xmlNodeBufGetContent_d.

5.60.1.34 xmlNodePtr xml_node_new (uchr_t * name)

Create an xml node.

Parameters:

name the name of the new xml node.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized xml node on success.

Definition at line 104 of file xml.c.

References xmlNewNode_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.60.1.35 void xml_node_set_content (xmlNodePtr *node*, uchr_t * *content*)

Set the content of an xml node.

Parameters:

node a pointer to the xml node to be set.

content a null-terminated string containing the new content of the xml node.

Returns:

This function returns no value.

Definition at line 150 of file xml.c.

References xmlNodeSetContent_d.

Referenced by contact_business_add_error(), portal_print_login(), teacher_add_error(), xml_set_xpath_ns(), and xml_set_xpath_uint64().

5.60.1.36 xmlAttrPtr xml_node_set_property (xmlNodePtr *node*, uchr_t * *name*, uchr_t * *value*)

Set an attribute of an xml node.

Parameters:

node a pointer to the xml node to be set.

name a null-terminated string containing the name of the node attribute to be set.

value a null-terminated string containing the new value of the specified xml node's attribute.

Returns:

NULL on failure, or a pointer to node's attribute on success.

Definition at line 163 of file xml.c.

References xmlSetProp_d.

Referenced by contact_business_add_error(), teacher_add_error(), and xml_set_xpath_property().

5.60.1.37 bool_t xml_set_xpath_ns (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uchr_t * *val*)

Set the value of a node element selected by an xpath expression, as a null-terminated string.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

val the new value of the selected node, as a null-terminated string.

Returns:

true if the value was set successfully, or false on failure.

Definition at line 702 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_content(), and xml_xpath_eval().

Referenced by contact_print_form(), contact_print_message(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.60.1.38 bool_t xml_set_xpath_property (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uchr_t * *name*, uchr_t * *val*)

Set the value of a specified property of a node element selected by an xpath expression.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

name a null-terminated string containing the name of the node's property to be set.

val the new value of the selected node's property, as a null-terminated string.

Returns:

true if the selected node's value was set successfully, or false on failure.

Definition at line 735 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_property(), and xml_xpath_eval().

Referenced by contact_print_form(), contact_print_message(), and teacher_print_form().

5.60.1.39 bool_t xml_set_xpath_uint64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uint64_t *val*)

Set the value of a node element selected by an xpath expression, as a 64-bit unsigned integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

val the new value of the selected node, as a 64-bit unsigned integer.

Returns:

true if the value was set successfully, or false on failure.

Definition at line 668 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_content(), and xml_xpath_eval().

Referenced by statistics_process().

5.60.1.40 bool_t xml_start (void)

Initialize the xml parser library.

Returns:

This function returns no value.

Definition at line 1079 of file xml.c.

References xmlInitParser_d.

Referenced by process_start().

5.60.1.41 void xml_stop (void)

Cleanup the state and allocated memory of the xml parser in preparation to be shutdown.

Returns:

This function returns no value.

Definition at line 1066 of file xml.c.

References xmlCleanupGlobals_d, xmlCleanupParser_d, and xmlMemoryDump_d.

Referenced by process_stop().

5.60.1.42 xmlXPathObjectPtr xml_xpath_eval (const uchr_t * *xpath*, xmlXPathContextPtr *ctx*)

Evaluate an xml xpath expression.

Parameters:

a null-terminated string containing the xpath expression to be evaluated.

a pointer to the xpath context in which to perform the evaluation. NULL on failure, or a pointer to the xml path object of the evaluation on success.

Definition at line 941 of file xml.c.

References log_pedantic, and xmlXPathEvalExpression_d.

Referenced by contact_business_add_error(), portal_print_login(), teacher_add_error(), xml_set_xpath_ns(), xml_set_xpath_property(), and xml_set_xpath_uint64().

5.60.1.43 int_t xml_xpath_set_namespace (xmlXPathContextPtr *ctxt*, xmlChar * *prefix*, xmlChar * *ns_uri*)

Set the namespace for an xpath context.

See also:

xmlXPathRegisterNs()

Parameters:

ctxt a pointer to the specified xpath context.

prefix a pointer to the prefix of the namespace as a string.

ns_uri a pointer to the uri of the namespace as a string.

Returns:

-1 on failure or 0 on success.

Definition at line 82 of file xml.c.

References xmlXPathRegisterNs_d.

Referenced by http_page_get().

5.61 src/core/parsers/special/bracket.c File Reference

```
#include "magma.h"
```

Functions

- [placer_t bracket_extract_pl](#) (void **block*, size_t [length](#))
Get a pointer to a block of data between a pair of brackets.

5.61.1 Function Documentation

5.61.1.1 [placer_t bracket_extract_pl](#) (void * *block*, size_t *length*)

Get a pointer to a block of data between a pair of brackets.

Note:

The data is of format "[_data_]"

Parameters:

block a buffer containing the bracketed data.

length the length, in bytes, of the data buffer to be parsed.

Returns:

a null placer on failure, or a placer pointing to the data between the brackets on success.

Definition at line 17 of file bracket.c.

References [data](#), [log_pedantic](#), [pl_init\(\)](#), and [pl_null\(\)](#).

Referenced by [cache_config\(\)](#), [relay_config\(\)](#), and [servers_config\(\)](#).

5.62 src/core/parsers/special/special.h File Reference

Functions

- `placer_t bracket_extract_pl` (void **block*, size_t *length*)
Get a pointer to a block of data between a pair of brackets.

5.62.1 Function Documentation

5.62.1.1 `placer_t bracket_extract_pl` (void * *block*, size_t *length*)

Get a pointer to a block of data between a pair of brackets.

Note:

The data is of format "[_data_]"

Parameters:

block a buffer containing the bracketed data.

length the length, in bytes, of the data buffer to be parsed.

Returns:

a null placer on failure, or a placer pointing to the data between the brackets on success.

Definition at line 17 of file bracket.c.

References `data`, `log_pedantic`, `pl_init()`, and `pl_null()`.

Referenced by `cache_config()`, `relay_config()`, and `servers_config()`.

5.63 src/core/parsers/time.c File Reference

```
#include "magma.h"
```

Functions

- `uint64_t time_till_midnight (void)`
Get the number of seconds until midnight.
- `uint64_t time_datestamp (void)`
Get the current date as an integer of the form YYYYMMDD.
- `stringer_t * time_print_local (stringer_t *s, chr_t *format, time_t moment)`
Get a specified time as a formatted string.
- `stringer_t * time_print_gmt (stringer_t *s, chr_t *format, time_t moment)`
Get a specified time as a formatted string converted to GMT.

5.63.1 Function Documentation

5.63.1.1 uint64_t time_datestamp (void)

Get the current date as an integer of the form YYYYMMDD. [time.c](#)

Returns:

0 on failure or a 64-bit unsigned integer containing the formatted current date on success.

Definition at line 36 of file `time.c`.

Referenced by `api_endpoint_auth()`, `imap_login()`, `log_rotate()`, `log_start()`, `pattern_update()`, `pop_pass()`, `portal_endpoint_auth()`, `process_maint()`, `smtp_auth_login()`, and `smtp_auth_plain()`.

5.63.1.2 stringer_t* time_print_gmt (stringer_t *s, chr_t *format, time_t moment)

Get a specified time as a formatted string converted to GMT.

Parameters:

- s* a managed string where the formatted time is to be stored.
- format* a null-terminated string containing the format of the time string.
- moment* the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 92 of file `time.c`.

References `log_pedantic`, `mm_wipe()`, `st_avail_get()`, `st_char_get()`, and `st_length_set()`.

Referenced by `http_response_cookie()`, `http_response_header()`, and `http_response_options()`.

5.63.1.3 `stringer_t* time_print_local (stringer_t * s, chr_t * format, time_t moment)`

Get a specified time as a formatted string.

Parameters:

s a managed string where the formatted time is to be stored.

format a null-terminated string containing the format of the time string.

moment the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 61 of file time.c.

References `log_pedantic`, `mm_wipe()`, `st_avail_get()`, `st_char_get()`, and `st_length_set()`.

Referenced by `imap_id()`, and `register_data_insert_user()`.

5.63.1.4 `uint64_t time_till_midnight (void)`

Get the number of seconds until midnight.

Returns:

an unsigned 64-bit integer containing the number of seconds until midnight, or 86400 on failure.

Definition at line 14 of file time.c.

Referenced by `process_maint()`.

5.64 src/core/parsers/token.c File Reference

```
#include "magma.h"
```

Functions

- `uint64_t tok_get_count_bl` (void *block, size_t length, char token)
Count the number of times a token is found in a specified block of memory.
- `uint64_t tok_get_count_st` (stringer_t *string, char token)
Count the number of times a token is found in a managed string.
- `int tok_get_ns` (char *string, size_t length, char token, uint64_t fragment, placer_t *value)
Retrieve a specified token from a null-terminated string.
- `int tok_get_bl` (void *block, size_t length, char token, uint64_t fragment, placer_t *value)
Retrieve a specified token from a block of data.
- `int tok_get_st` (stringer_t *string, char token, uint64_t fragment, placer_t *value)
Retrieve a specified token from a managed string.
- `int tok_get_pl` (placer_t string, char token, uint64_t fragment, placer_t *value)
Retrieve a specified token from a placer.
- `void tok_pop_init_bl` (tok_state_t *state, void *block, size_t length, char token)
- `void tok_pop_init_st` (tok_state_t *state, stringer_t *string, char token)
- `int tok_pop` (tok_state_t *state, placer_t *value)
- `uint64_t str_tok_get_count_bl` (void *block, size_t length, chr_t *token, size_t tokenlen)
Count the number of times a string token is found in a specified block of memory.
- `int str_tok_get_bl` (char *block, size_t length, chr_t *token, size_t tokenlen, uint64_t fragment, placer_t *value)
Retrieve a specified string-split token from a null-terminated string.
- `bool_t pl_skip_characters` (placer_t *place, char *skipchars, size_t nchars)
Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.
- `bool_t pl_skip_to_characters` (placer_t *place, char *skiptochars, size_t nchars)
Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.
- `bool_t pl_shrink_before_characters` (placer_t *place, char *shrinkchars, size_t nchars)
Truncate a placer to start before any of the specified characters, and update the placer accordingly.
- `bool_t pl_get_embraced` (placer_t str, placer_t *out, unsigned char opening, unsigned char closing, bool_t required)
Get a placer pointing to the text contained within a specified pair of opening and closing braces.
- `bool_t pl_update_start` (placer_t *place, size_t nchars, bool_t more)
Ensure that a placer contains at least a certain amount of data, and update it accordingly.

5.64.1 Function Documentation

5.64.1.1 `bool_t pl_get_embraced (placer_t str, placer_t * out, unsigned char opening, unsigned char closing, bool_t required)`

Get a placer pointing to the text contained within a specified pair of opening and closing braces.

Parameters:

- str* a placer pointing to the string to be parsed.
- out* a pointer to a placer that will store the string between the braces on success.
- opening* the character to be the opening brace of the sequence.
- closing* the character to be the closing brace of the sequence.
- required* if true, fail if no data was found between the pair of braces.

Returns:

true if the brace sequence was complete, or false if either component could not be located.

Definition at line 442 of file token.c.

References `pl_char_get()`, and `pl_empty()`.

5.64.1.2 `bool_t pl_shrink_before_characters (placer_t * place, char * shrinkchars, size_t nchars)`

Truncate a placer to start before any of the specified characters, and update the placer accordingly.

Parameters:

- place* a pointer to a placer that will be updated to be truncated before any of the specified characters.
- shrinkchars* a pointer to a buffer containing bytes that will be skipped when they are found at the end of the placer.
- nchars* the number of characters to be tested in the collection in *shrinkchars*.

Returns:

true if the shrink operation completed before the end of the placer was reached, or false otherwise.

Definition at line 405 of file token.c.

References `pl_char_get()`, `pl_empty()`, and `pl_length_get()`.

Referenced by `portal_upload()`.

5.64.1.3 `bool_t pl_skip_characters (placer_t * place, char * skipchars, size_t nchars)`

Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.

Parameters:

- place* a pointer to a placer that will be updated to skip past any of the specified characters.
- skipchars* a pointer to a buffer containing bytes that will be skipped at the beginning of the placer.
- nchars* the number of characters to be tested in the collection in *skipchars*.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 336 of file token.c.

References `pl_char_get()`, and `pl_empty()`.

Referenced by `portal_upload()`.

5.64.1.4 bool_t pl_skip_to_characters (placer_t * *place*, char * *skiptochars*, size_t *nchars*)

Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip to any of the specified characters.

skiptochars a pointer to a buffer containing bytes that will be skipped to when they are first found in the placer.

nchars the number of characters to be tested in the collection in *skiptochars*.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 372 of file token.c.

References `pl_char_get()`, and `pl_empty()`.

Referenced by `portal_upload()`.

5.64.1.5 bool_t pl_update_start (placer_t * *place*, size_t *nchars*, bool_t *more*)

Ensure that a placer contains at least a certain amount of data, and update it accordingly.

Parameters:

place a pointer to the placer containing the original data, which will be updated on success.

nchars the minimum number of characters that the placer needs to contain to pass the test.

more if true, more characters following the minimum buffer size are necessary.

Returns:

true if the placer meets the minimum size check, or false if it does not.

Definition at line 485 of file token.c.

5.64.1.6 int str_tok_get_bl (char * *block*, size_t *length*, chr_t * *token*, size_t *toklen*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified string-split token from a null-terminated string.

Parameters:

block a pointer to the block of memory to be tokenized.

length the maximum number of characters to be scanned from the input data.

token the token string that will be used to split the data.

toklen the length, in bytes, of the token string.

fragment the zero-indexed token number to be extracted from the data.

value a pointer to a placer that will receive the value of the extracted token on success, or `pl_null()` on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 290 of file token.c.

References `mm_empty()`, `pl_char_get()`, `pl_init()`, `pl_length_get()`, `pl_null()`, `placer_t`, and `st_search_cs()`.

Referenced by `portal_upload()`.

5.64.1.7 `uint64_t str_tok_get_count_bl (void * block, size_t length, chr_t * token, size_t toklen)`

Count the number of times a string token is found in a specified block of memory.

Parameters:

- block*** a pointer to a block of memory to be scanned.
- length*** the length, in bytes, of the block of memory to be scanned.
- token*** a pointer to the string token being used to split the input data.
- toklen*** the length, in bytes, of the specified token.

Returns:

the number of times the string token was found in the block of memory, or 0 on failure.

Definition at line 257 of file token.c.

References `count`, `mm_empty()`, `pl_init()`, `pl_length_get()`, `placer_t`, and `st_search_cs()`.

Referenced by `portal_upload()`.

5.64.1.8 `int tok_get_bl (void * block, size_t length, char token, uint64_t fragment, placer_t * value)`

Retrieve a specified token from a block of data.

See also:

[tok_get_ns\(\)](#)

Parameters:

- block*** a pointer to the memory block to be tokenized.
- length*** the maximum number of characters to be scanned at the input data block.
- token*** the token character that will be used to split the data block.
- fragment*** the zero-indexed token number to be extracted from the data block.
- value*** a pointer to a placer that will receive the value of the extracted token on success, or [pl_null\(\)](#) on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the data block.

Definition at line 128 of file token.c.

References `tok_get_ns()`.

Referenced by `nvp_parse()`, `smtp_parse_mail_from_path()`, `tok_get_pl()`, and `tok_get_st()`.

5.64.1.9 `uint64_t tok_get_count_bl (void * block, size_t length, char token)`

Count the number of times a token is found in a specified block of memory.

Parameters:

- block*** a pointer to a block of memory to be scanned.
- length*** the length, in bytes, of the block of memory to be scanned.
- token*** a character specifying the token to be searched.

Returns:

the number of times the token was found in the block of memory, or 0 on failure.

Definition at line 17 of file token.c.

References `count`, `log_pedantic`, and `mm_empty()`.

Referenced by `smtp_parse_mail_from_path()`, and `tok_get_count_st()`.

5.64.1.10 uint64_t tok_get_count_st (stringer_t * string, char token)

Count the number of times a token is found in a managed string.

See also:

[tok_get_count_bl\(\)](#)

Parameters:

string a pointer to the managed string to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the managed string, or 0 on failure.

Definition at line 49 of file token.c.

References `st_data_get()`, `st_length_get()`, and `tok_get_count_bl()`.

Referenced by `get_header_opt()`, `get_header_value_noopt()`, `http_parse_method()`, `http_parse_pairs()`, `imap_fetch_body_part()`, `imap_narrow_messages()`, `imap_search_messages_date()`, `imap_search_messages_date_compare()`, `imap_search_messages_range()`, `ip_subnet_st()`, `mail_domain_get()`, `mail_mime_type_parameters()`, `portal_get_upload_attachment()`, and `stamp_counter_check()`.

5.64.1.11 int tok_get_ns (char * string, size_t length, char token, uint64_t fragment, placer_t * value)

Retrieve a specified token from a null-terminated string.

Parameters:

string a pointer to the null-terminated string to be tokenized.

length the maximum number of characters to be scanned from the input string.

token the token character that will be used to split the string.

fragment the zero-indexed token number to be extracted from the string.

value a pointer to a placer that will receive the value of the extracted token on success, or [pl_null\(\)](#) on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 63 of file token.c.

References `log_pedantic`, `mm_empty()`, `pl_init()`, and `pl_null()`.

Referenced by `ip_subnet_st()`, `lib_load_openssl()`, and `tok_get_bl()`.

5.64.1.12 `int tok_get_pl (placer_t string, char token, uint64_t fragment, placer_t * value)`

Retrieve a specified token from a placer.

See also:

`token_get_ns()`

Parameters:

string a pointer to the placer to be tokenized.

token the token character that will be used to split the placer.

fragment the zero-indexed token number to be extracted from the placer.

value a pointer to a placer that will receive the value of the extracted token on success, or `pl_null()` on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the placer.

Definition at line 156 of file token.c.

References `pl_data_get()`, `pl_length_get()`, and `tok_get_bl()`.

Referenced by `http_data_value_parse()`, `http_parse_context()`, `http_parse_method()`, and `smtp_parse_mail_from_path()`.

5.64.1.13 `int tok_get_st (stringer_t * string, char token, uint64_t fragment, placer_t * value)`

Retrieve a specified token from a managed string.

See also:

`tok_get_ns()`

Parameters:

string a pointer to the managed string to be tokenized.

token the token character that will be used to split the managed string.

fragment the zero-indexed token number to be extracted from the managed string.

value a pointer to a placer that will receive the value of the extracted token on success, or `pl_null()` on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the managed string.

Definition at line 142 of file token.c.

References `st_data_get()`, `st_length_get()`, and `tok_get_bl()`.

Functions

- `void st_free (stringer_t *s)`
Free a managed string.
- `void st_cleanup_variadic (ssize_t len,...)`
A checked cleanup function which can be used free a variable number managed strings.
- `stringer_t * st_merge_opts (uint32_t opts, chr_t *format,...)`
Concatenate a variable number of user-supplied multi-type strings.
- `stringer_t * st_import_opts (uint32_t opts, const void *s, size_t len)`
Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.
- `stringer_t * st_import (const void *s, size_t len)`
Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.
- `stringer_t * st_copy_in (stringer_t *s, void *buf, size_t len)`
Copy data into a managed string.
- `stringer_t * st_dupe_opts (uint32_t opts, stringer_t *s)`
Create a duplicate copy of a managed string with a specified set of allocation options.
- `stringer_t * st_dupe (stringer_t *s)`
Duplicate a managed string.
- `stringer_t * st_append_opts (size_t align, stringer_t *s, stringer_t *append)`
Append one managed string to another, with aligned memory boundaries.
- `int_t st_append_out (size_t align, stringer_t **s, stringer_t *append)`
- `stringer_t * st_alloc_opts (uint32_t opts, size_t len)`
Allocate a managed string with a specified options mask.
- `stringer_t * st_alloc (size_t len)`
Allocate a managed string with a specified options mask.
- `stringer_t * st_realloc (stringer_t *s, size_t len)`
Reallocate a managed string to a specified size.
- `stringer_t * st_output (stringer_t *output, size_t len)`
Return a suitable managed string to store data of a specified length.
- `stringer_t * st_nullify (chr_t *input, size_t len)`
Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

5.66.1 Function Documentation

5.66.1.1 `stringer_t* st_alloc (size_t len)`

Allocate a managed string with a specified options mask.

See also:

[st_alloc_opts\(\)](#)

Parameters:

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 631 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_alloc_opts().

5.66.1.2 `stringer_t* st_alloc_opts (uint32_t opts, size_t len)`

Allocate a managed string with a specified options mask.

See also:

[st_valid_options\(\)](#)

Note:

All requested allocation masks should conform to the validation imposed by [st_valid_opts\(\)](#). The supported types are: placer, nuller, block, managed, and mapped. The following logic is applied to requested string allocation options: 1. Any allocation options specified for strings to be allocated on the stack are IGNORED. 2. All jointed strings allocate memory for the header and data separately and then link them EXCEPT: Jointed placers only allocate space for a header. Jointed mapped strings allocate the data with an aligned mmap() operation. 3. Contiguous strings allocate space for the header and data together in a single contiguous block. 4. After allocation, the length field is set for block strings. 5. After allocation, the available field is set for managed strings. 6. Placers can only be jointed; mapped strings can only be contiguous.

Parameters:

opts the allocation options mask to be used by the newly allocated string.

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 498 of file allocation.c.

References align(), block_t, BLOCK_T, CONTIGUOUS, HEAP, JOINTED, log_pedantic, magma, MAGMA_SPOOL_DATA, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, mm_alloc(), mm_free(), mm_sec_alloc(), mm_sec_free(), mm_set(), nuller_t, NULLER_T, magma_t::page_length, placer_t, PLACER_T, SECURE, spool_mktemp(), st_info_opts(), st_valid_opts(), and STACK.

5.66.1.3 stringer_t* st_append_opts (size_t align, stringer_t * s, stringer_t * append)

Append one managed string to another, with aligned memory boundaries.

Parameters:

align an alignment value to be used for managed string (re)allocation. This only works for powers of 2.

s the managed string to be extended, which will be allocated for the caller if passed as NULL.

append the managed string to be appended to *s*.

Returns:

NULL on failure, or a pointer to the appended result on success.

Definition at line 407 of file allocation.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, mm_copy(), st_alloc_opts(), st_avail_get(), st_data_get(), st_length_get(), st_length_set(), st_realloc(), and st_valid_append().

5.66.1.4 int_t st_append_out (size_t align, stringer_t ** s, stringer_t * append)

Definition at line 439 of file allocation.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, mm_copy(), st_alloc_opts(), st_avail_get(), st_data_get(), st_free(), st_length_get(), st_length_set(), st_realloc(), and st_valid_destination().

Referenced by encrypted_chunk_set().

5.66.1.5 void st_cleanup_variadic (ssize_t len, ...)

A checked cleanup function which can be used free a variable number managed strings.

See also:

[st_free\(\)](#)

Parameters:

va_list a list of managed strings to be freed.

Returns:

This function returns no value.

Definition at line 96 of file allocation.c.

References `st_free()`.

5.66.1.6 `stringer_t* st_copy_in (stringer_t * s, void * buf, size_t len)`

Copy data into a managed string.

Parameters:

- s* the managed string to store the copied contents of the data.
- buf* a pointer to the buffer containing the data to be copied.
- len* the length of the data to be copied.

Returns:

NULL on failure, or a pointer to the managed string on success.

Definition at line 279 of file allocation.c.

References `log_pedantic`, `mm_copy()`, `st_avail_get()`, `st_data_get()`, and `st_length_set()`.

Referenced by `pop_pass_parse()`.

5.66.1.7 `stringer_t* st_dupe (stringer_t * s)`

Duplicate a managed string.

See also:

[st_dupe_opts\(\)](#)

Note:

The allocation options of the duplicated string will be the same as that of the source string.

Parameters:

- s* the managed string to be duplicated.

Returns:

NULL on failure, or a copy of the input managed string on success.

Definition at line 393 of file allocation.c.

References `st_dupe_opts()`.

Referenced by `ar_dupe()`, `auth_login()`, `auth_response()`, `contact_folder_rename()`, `file_temp_handle()`, `http_load_file()`, `http_print_301()`, `imap_folder_create()`, `imap_folder_rename()`, `imap_login()`, `mail_add_forward_headers()`, `mail_add_outbound_headers()`, `mail_cache_get()`, `pop_pass()`, `prime_get()`, `prime_key_encrypt()`, `prime_pem_wrap()`, `register_business_step1()`, `register_business_step2()`, `register_print_message()`, `register_print_step1()`, `register_print_step2()`, `register_print_step3()`, `register_session_get()`, `smtp_add_recipient()`, `smtp_data_outbound()`, `smtp_fetch_inbound()`, `teacher_process()`, and `user_request_sign()`.

5.66.1.8 `stringer_t* st_dupe_opts (uint32_t opts, stringer_t * s)`

Create a duplicate copy of a managed string with a specified set of allocation options.

See also:

[st_valid_opts\(\)](#)

Note:

Both the source and destination managed strings must have option values that pass [st_valid_opts\(\)](#). The following procedure occurs when creating the duplicate managed string: If the destination is a placer, 0 bytes are allocated for the duplicate's underlying data. If the destination is a constant, nuller, or block, its underlying data buffer will be of equal size to the source's data length. If the destination is managed or mapped, and so is the source, its underlying data buffer will be of equal size to the source's available size; but if the source is neither, the underlying data buffer of the destination managed or mapped string will equal the size of the source's data length. A deep copy will be made of the source data to the destination if the destination is NOT a placer.

Parameters:

opts the allocation options mask to be used for the newly created managed string.
s the target managed string to be duplicated.

Returns:

NULL on failure or a pointer to a copy of the duplicated managed string on success.

Definition at line 319 of file allocation.c.

References [BLOCK_T](#), [CONSTANT_T](#), [log_pedantic](#), [MANAGED_T](#), [MAPPED_T](#), [MEMORYBUF](#), [mm_copy\(\)](#), [NULLER_T](#), [PLACER_T](#), [st_alloc_opts\(\)](#), [st_avail_get\(\)](#), [st_data_get\(\)](#), [st_data_set\(\)](#), [st_info_opts\(\)](#), [st_length_get\(\)](#), [st_length_set\(\)](#), [st_valid_opts\(\)](#), and [st_valid_tracked\(\)](#).

Referenced by [args_parse\(\)](#), [cache_set_value\(\)](#), [config_value_set\(\)](#), [file_temp_handle\(\)](#), [http_body\(\)](#), [http_data_value_parse\(\)](#), [http_load_file\(\)](#), [http_parse_header\(\)](#), [http_parse_method\(\)](#), [http_response_connection\(\)](#), [imap_fetch_response_add\(\)](#), [imap_folder_create\(\)](#), [imap_folder_rename\(\)](#), [magma_folder_name\(\)](#), [mail_add_forward_headers\(\)](#), [mail_cache_set\(\)](#), [mt_dupe\(\)](#), [portal_message_body\(\)](#), [relay_set_value\(\)](#), [servers_set_value\(\)](#), [sess_create\(\)](#), [smtp_client_send_data\(\)](#), [smtp_fetch_inbound\(\)](#), [smtp_forward_message\(\)](#), [smtp_relay_message\(\)](#), [st_dupe\(\)](#), [stacie_realm_cipher\(\)](#), [stacie_realm_tag\(\)](#), and [stacie_realm_vector\(\)](#).

5.66.1.9 void st_free (stringer_t * s)

Free a managed string.

See also:

[st_valid_free\(\)](#), [st_valid_opts\(\)](#)

Note:

Any managed string to be freed should conform with the validity checks enforced by [st_valid_free\(\)](#)/[st_valid_opts\(\)](#) *NO* managed string should be passed to [st_free\(\)](#) if it was allocated on the stack, or contains foreign data. The following logic is carried out depending on the allocation options of the string to be freed: Jointed placer: Free header, if secure or on heap Free underlying data if it is not foreign Jointed nuller: Free header and underlying data Jointed block: Free header and underlying data Jointed managed: Free header and underlying data Jointed mapped: Free the header and (munmap) underlying data Contiguous nuller: Free header (this includes the underlying data because they are already merged) Contiguous block: Free header (this includes the underlying data because they are already merged) Contiguous managed: Free header (this includes the underlying data because they are already merged)

Parameters:

s the managed string to be freed.

Returns:

This function returns no value.

HIGH: Finish this logic out. Stack allocations are skipped, unless they are jointed. In that case the data is freed unless it carries a foreigner flag. Note its possible for a jointed string to have a NULL data reference. We should be picking up on that too. Contiguous heap buffers are just destroyed.

Do we need to differentiate between stack structures, and heap data blocks needing to be freed, or not?

5.66.1.10 `stringer_t* st_import (const void *s, size_t len)`

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

See also:

[st_import_opts\(\)](#)

Parameters:

- s* the address of the buffer to be duplicated.
- len* the length, in bytes, of the copied buffer.

Returns:

- NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 267 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_import_opts().

5.66.1.11 stringer_t* st_import_opts (uint32_t *opts*, const void * *s*, size_t *len*)

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

Parameters:

- opts* the options value of the resulting managed string that will be allocated for the caller.
- s* the address of the buffer to be duplicated.
- len* the length, in bytes, of the copied buffer.

Returns:

NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 236 of file allocation.c.

References log_pedantic, MEMORYBUF, mm_copy(), st_alloc_opts(), st_data_get(), st_info_opts(), st_length_set(), and st_valid_destination().

Referenced by deprecated_ecies_key_private_hex(), ecies_key_private_hex(), and st_import().

5.66.1.12 stringer_t* st_merge_opts (uint32_t *opts*, chr_t * *format*, ...)

Concatenate a variable number of user-supplied multi-type strings.

Parameters:

- opts* the options value of the resulting managed string that will be allocated for the caller.
- format* a format string consisting of the characters 's' for specifying that the next variable argument will be a managed string or 'n' if it is a null-terminated string.
- ... a variable argument list containing the strings to be concatenated to one another.

Returns:

a newly allocated string containing the concatenations of all specified managed and null-terminated strings.

Definition at line 120 of file allocation.c.

References length, log_pedantic, MEMORYBUF, mm_copy(), ns_empty(), ns_length_get(), st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_empty, st_info_opts(), st_length_get(), st_length_set(), st_valid_destination(), and st_valid_tracked().

5.66.1.13 stringer_t* st_nullify (chr_t * *input*, size_t *len*)

Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

Parameters:

input a pointer to the data block to be copied.

len the size, in bytes, of the data block to be copied before being terminated with a null byte.

Returns:

NULL on failure, or a pointer to the new null-terminated string on success.

Definition at line 841 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, mm_copy(), st_alloc_opts(), st_data_get(), and st_length_set().

Referenced by portal_message_body().

5.66.1.14 stringer_t* st_output (stringer_t * *output*, size_t *len*)

Return a suitable managed string to store data of a specified length.

Note:

If a NULL output string is specified, one will be allocated for the caller.

Parameters:

output the input managed string (can be NULL).

len the size, in bytes, of the requested data buffer.

Returns:

NULL on failure or if input was not large enough or a pointer to a validated output managed string.

Definition at line 812 of file allocation.c.

5.66.1.15 stringer_t* st_realloc (stringer_t * *s*, size_t *len*)

Reallocate a managed string to a specified size.

Note:

The caller can request a new size that is either smaller (truncated) or larger than the original string. Only these types of strings can be reallocated: nuller, block, managed, and mapped. The following logic is applied to string reallocation requests: For jointed strings, a new data buffer is allocated of the requested length, the original contents copied in, the data field of the new string is set, and the original data buffer freed. The stringer header returned to the caller resides at the same address as the original. For contiguous strings, a new data buffer is allocated for both the requested length and the new stringer header, and the data of both parts are copied from the original string to the resulting one. For block strings, the length field of the resulting string is set to the requested length. For managed strings, the length field of the resulting string is set to the original length, but the available field is adjusted accordingly. For mapped strings, an aligned mremap() call is made, and both the length and available fields are set to the new length.

Parameters:

s the managed string to have its size reallocated.

len the new size, in bytes, of the resulting managed string.

Returns:

NULL on failure or a pointer to the newly reallocated managed string on success.

Definition at line 656 of file allocation.c.

Functions

- [bool_t st_populated_variadic](#) (ssize_t len,...)
A simple method for checking multiple managed strings to ensure all of the provided strings have contain at least one character of data.
- [bool_t st_empty_variadic](#) (ssize_t len,...)
A simple method for checking multiple managed strings to see if any are empty.
- [bool_t st_empty_out](#) (stringer_t *s, uchr_t **ptr, size_t *len)
Determine whether the specified managed string is empty or not, and store its underlying data and data length.
- void [st_data_set](#) (stringer_t *s, void *data)
Set the underlying data of a jointed managed string.
- void * [st_data_get](#) (stringer_t *s)
Retrieve the data associated with a managed string.
- [chr_t * st_char_get](#) (stringer_t *s)
Retrieve a character pointer to a managed string's data buffer.
- [uchr_t * st_uchar_get](#) (stringer_t *s)
Retrieve an unsigned character pointer to a managed string's data buffer.
- void [st_wipe](#) (stringer_t *s)
Wipe all of a managed string's allocated memory and if applicable, reset its length.
- [stringer_t * st_set](#) (stringer_t *s, uint8_t set, size_t len)
Sets a block of memory to a specified value.

5.67.1 Function Documentation

5.67.1.1 chr_t* st_char_get (stringer_t * s)

Retrieve a character pointer to a managed string's data buffer. data.c

See also:

[st_data_get\(\)](#)

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 196 of file data.c.

5.67.1.2 void* st_data_get (stringer_t * s)

Retrieve the data associated with a managed string.

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 149 of file data.c.

5.67.1.3 void st_data_set (stringer_t * s, void * data)

Set the underlying data of a jointed managed string.

Parameters:

s the managed string to be adjusted.

data the data buffer to be attached to the input managed string.

Note:

The underlying data of *s* will be released, unless it contains foreign data.

Returns:

This function does not return a value.

Definition at line 92 of file data.c.

References block_t, BLOCK_T, FOREIGNDATA, JOINTED, log_pedantic, managed_t, MANAGED_T, MAPPED_T, MEMORYBUF, mm_free(), mm_sec_free(), mm_sec_secured(), nuller_t, NULLER_T, placer_t, PLACER_T, SECURE, st_info_opts(), and st_valid_jointed().

Referenced by contact_name(), ephemeral_chunk_set(), smtp_data_finish(), smtp_data_read(), and st_dupe_opts().

5.67.1.4 bool_t st_empty_out (stringer_t * s, uchr_t ** ptr, size_t * len)

Determine whether the specified managed string is empty or not, and store its underlying data and data length.

Parameters:

s the input managed string.

ptr a pointer to a null-terminated string that will receive the address of the managed string's underlying data.

len a pointer to store the size of the managed string's underlying data buffer.

Returns:

true if string is NULL or uninitialized or empty; false otherwise.

Definition at line 76 of file data.c.

References st_data_get(), and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), auth_sanitise_address(), base64_decode(), base64_decode_mod(), base64_decode_opts(), base64_encode(), base64_encode_mod(), base64_encode_opts(), base64_encode_wrap(), chunk_buffer_size(), chunk_header_size(), chunk_header_type(), client_write(), contact_name(), contact_validate_detail(), contact_validate_name(), deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), deprecated_symmetric_decrypt(), deprecated_symmetric_encrypt(), ecies_decrypt(), ecies_encrypt(), ephemeral_chunk_set(), hex_count_st(), hex_decode_st(), hex_encode_st(), hex_valid_st(), http_parse_origin(), imap_command_log_safe(), imap_count_folder_levels(), imap_fetch_body_portion(), imap_valid_folder_name(), imap_valid_sequence(), lower_st(), mail_count_received(), mail_extract_address(), mail_mime_encode_part(), naked_message_get(), part_decrypt(), part_encrypt(), prime_field_write(), prime_header_read(), qp_decode(), qp_encode(), smtp_parse_auth(), st_cmp_ci_ends(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_cmp_cs_starts(), st_replace(), st_search_chr(), st_search_ci(), st_search_cs(), st_swap(), st_write_variadic(), stacie_decrypt(), stacie_derive_key(), stacie_derive_seed(), stacie_derive_token(), stacie_encrypt(), stacie_realm_key(), symmetric_decrypt(), symmetric_encrypt(), upper_st(), url_decode(), url_encode(), url_valid_st(), utf8_length_st(), utf8_valid_st(), zbase32_decode(), and zbase32_encode().

5.67.1.5 bool_t st_empty_variadic (ssize_t len, ...)

A simple method for checking multiple managed strings to see if any are empty.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to check for emptiness

Returns:

true if any of the strings are NULL, uninitialized or empty; false if every string has at least one byte of data.

Definition at line 48 of file data.c.

References st_data_get(), and st_length_get().

5.67.1.6 `bool_t st_populated_variadic (ssize_t len, ...)`

A simple method for checking multiple managed strings to ensure all of the provided strings have contain at least one character of data.

Parameters:

- len* the number of strings being passed in.
- va_list* a list of managed strings to be validated.

Returns:

true if all of the strings are populated with at least one byte of data, otherwise false.

Definition at line 19 of file data.c.

References `st_data_get()`, and `st_length_get()`.

5.67.1.7 `stringer_t* st_set (stringer_t * s, uint8_t set, size_t len)`

Sets a block of memory to a specified value.

Parameters:

- s* the managed string to be overwritten with the value of set.
- set* the byte value to be write into the string.
- len* the number of bytes to set to the provided value.

Returns:

a pointer to the block of memory passed to the function.

Definition at line 246 of file data.c.

References `log_pedantic`, `MEMORYBUF`, `mm_set()`, `st_avail_get()`, `st_data_get()`, `st_info_opts()`, `st_length_set()`, `st_valid_opts()`, and `st_valid_tracked()`.

Referenced by `encrypted_chunk_get()`, `encrypted_chunk_set()`, and `slots_key()`.

5.67.1.8 `uchar_t* st_uchar_get (stringer_t * s)`

Retrieve an unsigned character pointer to a managed string's data buffer.

See also:

[st_data_get\(\)](#)

Parameters:

- s* the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 206 of file data.c.

References `st_data_get()`.

Referenced by `dkim_signature_create()`, `http_parse_origin()`, and `prime_pem_unwrap()`.

5.67.1.9 void st_wipe (stringer_t * s)

Wipe all of a managed string's allocated memory and if applicable, reset its length.

Parameters:

s the managed string to be wiped.

Returns:

This function returns no value.

Definition at line 216 of file data.c.

References log_pedantic, MEMORYBUF, mm_wipe(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

Functions

- `uint64_t tank_insert_object` (`int64_t transaction`, `uint64_t hnum`, `uint64_t tnum`, `uint64_t unum`, `uint64_t size`, `uint64_t flags`)
Insert a tank object into the mysql database.
- `bool_t tank_delete_object` (`int64_t transaction`, `uint64_t hnum`, `uint64_t tnum`, `uint64_t unum`, `uint64_t onum`)
Delete a tank object from the mysql database.

5.68.1 Function Documentation

5.68.1.1 `bool_t tank_delete_object` (`int64_t transaction`, `uint64_t hnum`, `uint64_t tnum`, `uint64_t unum`, `uint64_t onum`)

Delete a tank object from the mysql database.

Parameters:

transaction a mysql connection identifier for which a transaction has been started.

hnum the host number.

tnum the storage tank number.

unum the usernum of the user that owns the object.

onum the stored object id.

Returns:

false on failure, or true on success.

Definition at line 67 of file data.c.

References `log_pedantic`, `mm_wipe()`, and `stmt_exec_affected_conn()`.

Referenced by `tank_delete()`.

5.68.1.2 `uint64_t tank_insert_object` (`int64_t transaction`, `uint64_t hnum`, `uint64_t tnum`, `uint64_t unum`, `uint64_t size`, `uint64_t flags`)

Insert a tank object into the mysql database.

Parameters:

transaction a mysql connection identifier for which a transaction has been started.

hnum the host number.

tnum the storage tank number.

unum the usernum of the user that owns the object.

size the length, in bytes, of the object to be stored.

flags 0 on failure, or the objectnum field for the newly inserted object.

Definition at line 19 of file data.c.

References `mm_wipe()`, and `stmt_insert_conn()`.

Referenced by `tank_store()`.

Functions

- void [http_data_free](#) ([http_data_t](#) *data)
Free an http data object.
- [http_data_t](#) * [http_data_get](#) ([connection_t](#) *con, [HTTP_DATA](#) source, [chr_t](#) *name)
Get a name/value pair associated with an http connection, by name.
- void [http_data_value_decode](#) ([stringer_t](#) *string)
Decode an escaped URI component into its original data.
- [int_t](#) [http_data_value_parse](#) ([connection_t](#) *con, [HTTP_DATA](#) source, [placer_t](#) pair)
Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.
- [http_data_t](#) * [http_data_header_parse_line](#) ([chr_t](#) *buf, [size_t](#) len)
Parse a data buffer into a http header name/value pair.
- [http_data_t](#) * [http_data_header_parse](#) ([connection_t](#) *con)
Parse the current line of input from an http client connection into a http header name/value pair.

5.69.1 Function Documentation

5.69.1.1 void http_data_free (http_data_t * data)

Free an http data object. data.c

Parameters:

data the http data object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file data.c.

References [mm_free\(\)](#), [http_data_t::name](#), [st_cleanup](#), and [http_data_t::value](#).

Referenced by [http_data_value_parse\(\)](#), [http_parse_header\(\)](#), [http_parse_pairs\(\)](#), and [portal_upload\(\)](#).

5.69.1.2 http_data_t* http_data_get (connection_t * con, HTTP_DATA source, chr_t * name)

Get a name/value pair associated with an http connection, by name.

Note:

The name/value pairs searched can be supplied by a client through http request headers, or through GET or POST data.

Parameters:

con the connection object to be queried.

source the source of the client supplied value pair: HTTP_DATA_GET, HTTP_DATA_POST or HTTP_DATA_ANY.

name the name associated with the name/value pair to be retrieved.

Returns:

NULL on failure, or a pointer to the http name/value data pair requested on success.

TODO: We could just use the index find function.

Definition at line 34 of file data.c.

References data, HTTP_DATA_ANY, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), http_data_t::name, NULLER, http_data_t::source, and st_cmp_ci_eq().

Referenced by contact_business(), contact_print_form(), contact_process(), http_body(), http_response_allow_cross(), multipart_get_boundary(), register_business_step1(), register_business_step2(), register_process(), and teacher_process().

5.69.1.3 http_data_t* http_data_header_parse (connection_t * con)

Parse the current line of input from an http client connection into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 226 of file data.c.

References http_data_header_parse_line(), st_char_get(), and st_length_get().

Referenced by http_parse_header().

5.69.1.4 http_data_t* http_data_header_parse_line (chr_t * buf, size_t len)

Parse a data buffer into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 163 of file data.c.

References HTTP_DATA_HEADER, mm_alloc(), http_data_t::name, http_data_t::source, st_free(), st_import(), and http_data_t::value.

Referenced by http_data_header_parse(), and portal_upload().

5.69.1.5 void http_data_value_decode (stringer_t * string)

Decode an escaped URI component into its original data.

Note:

Since the un-escaped string will always be at least as small as the encoded value, the input managed string is transformed in place.

Parameters:

string a managed string containing the escaped URI data to be decoded.

Returns:

This function returns no value.

Definition at line 68 of file data.c.

References `hex_decode_chr()`, `length`, `st_char_get()`, `st_length_get()`, and `st_length_set()`.

Referenced by `http_data_value_parse()`.

5.69.1.6 int_t http_data_value_parse (connection_t * con, HTTP_DATA source, placer_t pair)

Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.

Note:

Each name/value pair is assumed to be delimited with a '=' character, and each half is URI-decoded before storage.

Parameters:

con a pointer to the connection object of the http client submitting the user data to be parsed.

source an HTTP_DATA value specifying the source of the name/value pair (can be HTTP_DATA_HEADER, HTTP_DATA_GET, or HTTP_DATA_POST).

pair a placer pointing to a string containing the name/value pair to be parsed.

Returns:

0 on general or parsing failure, or 1 if the specified input buffer was successfully parsed and stored.

Definition at line 111 of file data.c.

References `CONTIGUOUS`, `data`, `HEAP`, `magma_t::http`, `http_data_free()`, `http_data_value_decode()`, `inx_insert()`, `magma_t::log`, `log_pedantic`, `M_TYPE_STRINGER`, `magma`, `MANAGED_T`, `mm_alloc()`, `http_data_t::name`, `pl_empty()`, `placer_t`, `http_data_t::source`, `multi_t::st`, `st_char_get()`, `st_dupe_opts()`, `st_free()`, `st_length_int()`, `tok_get_pl()`, `multi_t::val`, and `http_data_t::value`.

5.70.1 Function Documentation

5.70.1.1 `const chr_t* st_info_allocator (uint32_t opts)`

Get a readable description of a managed string's allocator type.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's allocator type.

Definition at line 96 of file info.c.

References `HEAP`, `SECURE`, `st_option_allocators`, and `STACK`.

Referenced by `st_info_opts()`.

5.70.1.2 `const chr_t* st_info_layout (uint32_t opts)`

Get a readable description of a managed string's data layout.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's data layout.

Definition at line 75 of file info.c.

References CONTIGUOUS, JOINTED, and st_option_layouts.

Referenced by st_info_opts().

5.70.1.3 chr_t* st_info_opts (uint32_t opts, chr_t * s, size_t len)

Get a readable description of all of a managed string's option flags.

Parameters:

opts a value containing the managed string's option mask.

s a pointer to a null-terminated string to receive the options description.

len the length, in bytes, of the description output buffer.

Returns:

NULL on failure, or a pointer to the output buffer containing the managed string's options description on success.

LOW: Turn this into a loop.

Definition at line 122 of file info.c.

Functions

- `size_t st_length_get (stringer_t *s)`
Return the length of the data in a managed string.
- `int_t st_length_int (stringer_t *s)`
Length.
- `size_t st_length_set (stringer_t *s, size_t len)`
Set the data length for a managed string that supports data length tracking.
- `size_t st_avail_get (stringer_t *s)`
Return the total data buffer size allocated for a managed string.
- `size_t st_avail_set (stringer_t *s, size_t avail)`
Set the total data buffer size allocated for a managed string.

5.71.1 Function Documentation

5.71.1.1 size_t st_avail_get (stringer_t * s)

Return the total data buffer size allocated for a managed string.

Parameters:

`s` the input managed string.

Returns:

0 on failure, or the total buffer size in bytes on success.

Definition at line 146 of file length.c.

5.71.1.2 size_t st_avail_set (stringer_t * s, size_t avail)

Set the total data buffer size allocated for a managed string.

Parameters:

- s* the input managed string.
- avail* the new buffer size for the managed string.

Returns:

0 on failure, or the managed string's new buffer size in bytes on success.

Definition at line 183 of file length.c.

References log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, st_info_opts(), and st_valid_avail().

5.71.1.3 size_t st_length_get (stringer_t * s)

Return the length of the data in a managed string.

Parameters:

- s* the input managed string.

Returns:

0 on failure, or the length of the managed string's data in bytes.

Definition at line 15 of file length.c.

5.71.1.4 int_t st_length_int (stringer_t * s)

Length. Return the length of a managed string as an integer.

Parameters:

s the managed string as type stringer_t *.

Returns:

the string length as an integer, capped at INT_MAX.

Definition at line 70 of file length.c.

References log_pedantic, st_length_get(), and st_valid_opts().

5.71.1.5 size_t st_length_set (stringer_t * s, size_t len)

Set the data length for a managed string that supports data length tracking.

Parameters:

- s* the input managed string.
- len* the new value of the managed string's data length.

Returns:

- 0 on error, or the new data length on success.

Definition at line 99 of file length.c.

Functions

- [multi_t mt_get_null](#) (void)
Return an empty multi-type object.
- [bool_t mt_is_empty](#) (multi_t multi)
Determine whether a multi-type object is empty.
- [bool_t mt_is_number](#) (multi_t multi)
Determine whether a multi-type object is a number.
- [uint64_t mt_get_number](#) (multi_t multi)
Get the value of a numerical multi-type object.
- [char * mt_get_char](#) (const multi_t *multi)
Get a character pointer to the value of a multi-type object.
- [size_t mt_get_length](#) (multi_t multi)
Get the length of the data associated with a multi-type object.
- [M_TYPE mt_get_type](#) (multi_t multi)
Get the data type associated with a multi-type object.
- [multi_t mt_set_type](#) (multi_t multi, M_TYPE target)
Set the data type of a multi-type data object.
- [void mt_free](#) (multi_t multi)
Free the data underlying a multi-type data object (for managed and null-terminated strings).
- [multi_t mt_dupe](#) (multi_t multi)
Duplicate a multi-type object.
- [bool_t ident_mt_mt](#) (multi_t one, multi_t two)
Check to see if the values of two multi-type objects are identical.
- [int32_t cmp_mt_mt](#) (multi_t one, multi_t two)
Compare the values of two multi-type objects of the same data type.

5.72.1 Function Documentation

5.72.1.1 int32_t cmp_mt_mt (multi_t one, multi_t two)

Compare the values of two multi-type objects of the same data type. [multi.c](#)

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

- one* the first multi-type object to be compared.
- two* the second multi-type object to be compared.

Returns:

Definition at line 682 of file multi.c.

References multi_t::binary, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, log_pedantic, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, mt_get_type(), multi_t::ns, NULLER, multi_t::st, st_cmp_cs_eq(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by tree_cmp().

5.72.1.2 bool_t ident_mt_mt (multi_t one, multi_t two)

Check to see if the values of two multi-type objects are identical.

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

- one* the first multi-type object to be compared.
- two* the second multi-type object to be compared.

Returns:

true if the two objects have identical values; false if they don't, or on failure.

Definition at line 567 of file multi.c.

Referenced by hashed_bucket_find_key(), hashed_delete(), linked_delete(), and linked_find().

5.72.1.3 multi_t mt_dupe (multi_t multi)

Duplicate a multi-type object.

Parameters:

- multi* the multi-type object to be examined.

Returns:

a copy of the input object (a deep copy for managed strings and null-terminated strings).

Definition at line 484 of file multi.c.

References `multi_t::binary`, `CONTIGUOUS`, `multi_t::dbl`, `multi_t::fl`, `HEAP`, `multi_t::i16`, `multi_t::i32`, `multi_t::i64`, `multi_t::i8`, `log_pedantic`, `M_TYPE_BOOLEAN`, `M_TYPE_DOUBLE`, `M_TYPE_FLOAT`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `MANAGED_T`, `mt_get_null()`, `multi_t::ns`, `ns_dupe()`, `multi_t::st`, `st_dupe_opts()`, `type()`, `multi_t::type`, `multi_t::u16`, `multi_t::u32`, `multi_t::u64`, `multi_t::u8`, and `multi_t::val`.

Referenced by `hashed_bucket_alloc()`, `linked_record_alloc()`, and `tree_insert()`.

5.72.1.4 `void mt_free (multi_t multi)`

Free the data underlying a multi-type data object (for managed and null-terminated strings).

Parameters:

multi the multi-type object to be freed.

Returns:

This function returns no value.

Definition at line 462 of file `multi.c`.

References `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `multi_t::ns`, `ns_free()`, `multi_t::st`, `st_free()`, `multi_t::type`, and `multi_t::val`.

5.72.1.5 `char* mt_get_char (const multi_t * multi)`

Get a character pointer to the value of a multi-type object.

Parameters:

multi a pointer to the multi-type object to be examined.

a pointer to the value of the input object, or `NULL` on failure.

Returns:

null on error

Definition at line 172 of file `multi.c`.

Referenced by `hashed_bucket()`.

5.72.1.6 `size_t mt_get_length (multi_t multi)`

Get the length of the data associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the length in bytes of the data associated with the input object, or 0 on failure.

Definition at line 249 of file multi.c.

References `log_options`, `M_LOG_PEDANTIC`, `M_LOG_STACK_TRACE`, `M_TYPE_BOOLEAN`, `M_TYPE_DOUBLE`, `M_TYPE_FLOAT`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `multi_t::ns`, `ns_length_get()`, `multi_t::st`, `st_length_get()`, `type()`, `multi_t::type`, and `multi_t::val`.

Referenced by `hashed_bucket()`.

5.72.1.7 `multi_t mt_get_null (void)`

Return an empty multi-type object.

Returns:

an empty multi-type object.

Definition at line 17 of file multi.c.

References `EMPTY`, and `multi_t::type`.

Referenced by `hashed_cursor_key_active()`, `hashed_cursor_key_next()`, `inx_cursor_key_active()`, `inx_cursor_key_next()`, `linked_cursor_key_active()`, `linked_cursor_key_next()`, `linked_record_get_key()`, `mt_dupe()`, `tree_cursor_key_next()`, and `tree_cursor_next()`.

5.72.1.8 `uint64_t mt_get_number (multi_t multi)`

Get the value of a numerical multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the numerical value of the input object, or 0 on failure.

Definition at line 116 of file multi.c.

References `multi_t::dbl`, `multi_t::fl`, `multi_t::i16`, `multi_t::i32`, `multi_t::i64`, `multi_t::i8`, `log_options`, `M_LOG_PEDANTIC`, `M_LOG_STACK_TRACE`, `M_TYPE_BLOCK`, `M_TYPE_BOOLEAN`, `M_TYPE_DOUBLE`, `M_TYPE_EMPTY`, `M_TYPE_FLOAT`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `type()`, `multi_t::type`, `multi_t::u16`, `multi_t::u32`, `multi_t::u64`, `multi_t::u8`, and `multi_t::val`.

Referenced by `hashed_bucket()`.

5.72.1.9 `M_TYPE mt_get_type (multi_t multi)`

Get the data type associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the data type of the input object, or `EMPTY` on failure.

Definition at line 318 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by cmp_mt_mt(), and ident_mt_mt().

5.72.1.10 bool_t mt_is_empty (multi_t *multi*)

Determine whether a multi-type object is empty.

Note:

All numeric (including boolean and floating point) types will always return false.

Parameters:

multi the multi-type object to be examined.

Returns:

true if the object is empty (by type or value), or false otherwise.

Definition at line 31 of file multi.c.

References multi_t::bl, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_empty(), multi_t::st, st_empty, type(), multi_t::type, and multi_t::val.

Referenced by config_load_cmdline_settings(), config_load_file_settings(), and tree_insert().

5.72.1.11 bool_t mt_is_number (multi_t *multi*)

Determine whether a multi-type object is a number.

Parameters:

multi the multi-type object to be examined. return true if the input object is any integer, boolean, or floating point; false otherwise.

Definition at line 80 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by hashed_bucket().

5.72.1.12 multi_t mt_set_type (multi_t *multi*, M_TYPE *target*)

Set the data type of a multi-type data object.

Parameters:

multi the multi-type object to be adjusted.

target the value of the new data type for the input object.

Returns:

a copy of the modified multi-type data object.

Definition at line 391 of file multi.c.

Functions

- `size_t ns_length_get (const chr_t *s)`
Return the length of a null-terminated string.
- `bool_t ns_empty (chr_t *s)`
Return whether a null-terminated string is empty or not.
- `bool_t ns_empty_out (chr_t *s, chr_t **ptr, size_t *len)`
Return whether a null-terminated string is empty or not, while storing its address and length.
- `int ns_length_int (chr_t *s)`
Return the length of a null-terminated string as an int, capped at INT_MAX.
- `chr_t * ns_alloc (size_t len)`
Allocate (and wipe) a buffer for a null-terminated string.
- `void ns_free (chr_t *s)`
Free a null-terminated string.
- `bool_t ns_populated_variadic (ssize_t len,...)`
A simple method for checking multiple NULL terminated strings to ensure all of the provided pointers lead to a buffer with at least one non-NULL character.
- `void ns_cleanup_variadic (ssize_t len,...)`
A checked cleanup function which can be used free a variable number of null-terminated strings.
- `chr_t * ns_dupe (chr_t *s)`
Duplicate a null-terminated string.
- `chr_t * ns_import (void *block, size_t len)`
Get a block of memory as a null-terminated string.
- `chr_t * ns_append (chr_t *s, chr_t *append)`
Append one string to another and return the result.
- `void ns_wipe (chr_t *s, size_t len)`
Zero out a null-terminated string.

5.73.1 Function Documentation

5.73.1.1 chr_t* ns_alloc (size_t len)

Allocate (and wipe) a buffer for a null-terminated string. [nuller.c](#)

Parameters:

len the length of the buffer to be allocated.

Returns:

NULL on failure or if len was 0; a pointer to the newly allocated memory otherwise.

Definition at line 68 of file nuller.c.

References `log_pedantic`, `mm_alloc()`, and `ns_wipe()`.

Referenced by `deserialize_ns()`, `mail_message_path()`, and `ns_append()`.

5.73.1.2 `chr_t* ns_append (chr_t * s, chr_t * append)`

Append one string to another and return the result.

Parameters:

s a pointer to a leading null-terminated string to to which the other string will be appended.

append a pointer to a null-terminated string to be appended to the leading string.

Returns:

NULL if a memory allocation failure occurred, or a pointer to the resulting string on success.

Definition at line 211 of file nuller.c.

References `log_pedantic`, `mm_copy()`, `ns_alloc()`, `ns_dupe()`, `ns_free()`, and `ns_length_get()`.

Referenced by `api_response()`, `portal_endpoint_error()`, and `portal_endpoint_response()`.

5.73.1.3 `void ns_cleanup_variadic (ssize_t len, ...)`

A checked cleanup function which can be used free a variable number of null-terminated strings.

See also:

[ns_free\(\)](#)

Parameters:

va_list a list of null-terminated strings to be freed.

Returns:

This function returns no value.

Definition at line 146 of file nuller.c.

References `ns_free()`.

5.73.1.4 `chr_t* ns_dupe (chr_t * s)`

Duplicate a null-terminated string.

Parameters:

s the null-terminated string to be duplicated.

Returns:

NULL on failure, or a pointer to a copy of the input string.

Definition at line 167 of file nuller.c.

References `length`, `log_info`, `log_pedantic`, `mm_alloc()`, `mm_copy()`, and `ns_length_get()`.

Referenced by `cache_set_value()`, `config_value_set()`, `mt_dupe()`, `ns_append()`, `relay_set_value()`, `servers_set_value()`, and `xml_get_xpath_ns()`.

5.73.1.5 `bool_t ns_empty (chr_t * s)`

Return whether a null-terminated string is empty or not.

Parameters:

s the input as a null-terminated string.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 29 of file nuller.c.

References `ns_length_get()`.

Referenced by `cache_free()`, `cache_output_settings()`, `cache_set_value()`, `cache_validate()`, `config_output_value()`, `config_output_value_generic()`, `config_value_set()`, `dkim_signature_create()`, `lib_load()`, `mail_mime_get_media_type()`, `mt_is_empty()`, `relay_free()`, `relay_output_settings()`, `relay_set_value()`, `relay_validate()`, `servers_free()`, `servers_output_settings()`, `servers_set_value()`, `servers_validate()`, `sql_start()`, and `st_merge_opts()`.

5.73.1.6 `bool_t ns_empty_out (chr_t * s, chr_t ** ptr, size_t * len)`

Return whether a null-terminated string is empty or not, while storing its address and length.

Parameters:

s the input as a null-terminated string.

ptr a pointer address to receive a copy of the string's location.

len a pointer to a variable to receive the length of the string, in bytes.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 41 of file nuller.c.

References `ns_length_get()`.

5.73.1.7 `void ns_free (chr_t * s)`

Free a null-terminated string.

Parameters:

s the string to be freed.

Returns:

This function returns no value.

Definition at line 95 of file nuller.c.

References `log_pedantic`, and `mm_free()`.

Referenced by `api_response()`, `cache_free()`, `cache_set_value()`, `config_free()`, `config_value_set()`, `ip_subnet_st()`, `mail_copy_message()`, `mail_load_message()`, `mail_message_path()`, `mail_remove_message()`, `mail_store_message()`, `mail_store_message_data()`, `mt_free()`, `ns_append()`, `ns_cleanup_variadic()`, `portal_endpoint_error()`, `portal_endpoint_response()`, `relay_free()`, `relay_set_value()`, `servers_free()`, and `servers_set_value()`.

5.73.1.8 `chr_t* ns_import (void *block, size_t len)`

Get a block of memory as a null-terminated string.

Parameters:

block a pointer to the buffer containing the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

NULL on failure, or a pointer to the newly allocated null-terminated string on success.

Definition at line 192 of file nuller.c.

References `log_pedantic`, `mm_alloc()`, and `mm_copy()`.

Referenced by `cache_set_value()`, `config_value_set()`, `ip_subnet_st()`, `relay_set_value()`, and `servers_set_value()`.

5.73.1.9 `size_t ns_length_get (const chr_t *s)`

Return the length of a null-terminated string. LOW: The `ns_` functions are designed to work with NULL terminated strings. They shouldn't require a length. If the length needs to be provided, then the equivalent `mm_` function should be used.

Parameters:

s the input as a null-terminated string.

Returns:

the length in bytes of the string.

Definition at line 18 of file nuller.c.

Referenced by `api_endpoint_delete_user()`, `api_endpoint_register()`, `api_response()`, `build_version_major()`, `build_version_minor()`, `build_version_patch()`, `con_reverse_lookup()`, `con_write_ns()`, `config_fetch_host_number()`, `config_fetch_settings()`, `deprecated_ecies_key_private_hex()`, `deprecated_ecies_key_public_hex()`, `ecies_key_private_hex()`, `ecies_key_public_hex()`, `file_temp_handle()`, `host_platform()`, `host_version()`, `http_load_file()`, `ident_mt_mt()`, `imap_build_array()`, `imap_fetch_bodystructure()`, `imap_fetch_message()`, `imap_search_messages_date()`, `int16_conv_ns()`, `int32_conv_ns()`, `int64_conv_ns()`, `int8_conv_ns()`, `ip_addr_st()`, `ip_presentation()`, `ip_subnet_st()`, `lib_load_openssl()`, `line_pl_ns()`, `log_rotate()`, `log_start()`, `mail_mime_get_media_type()`, `mail_path_finder()`, `meta_folders_name()`, `mt_get_length()`, `ns_append()`, `ns_dupe()`, `ns_empty()`, `ns_empty_out()`, `ns_length_int()`, `portal_endpoint()`, `portal_endpoint_attachments_add()`, `portal_endpoint_error()`, `portal_endpoint_folders_add()`, `portal_endpoint_folders_rename()`, `portal_endpoint_response()`, `portal_parse_json_str_array()`, `rand_choices()`, `register_data_insert_user()`, `register_print_step1()`, `register_print_step2()`, `servers_network_start()`, `smtp_client_send_helo()`, `spool_path()`, `st_merge_opts()`, `stmt_rebuild()`, `stmt_start()`, `tank_start()`, `teacher_add_cookie()`, `uint16_conv_ns()`, `uint32_conv_ns()`, `uint64_conv_ns()`, `uint8_conv_ns()`, `virus_check()`, `xml_get_xpath_int16()`, `xml_get_xpath_int32()`, `xml_get_xpath_int64()`, `xml_get_xpath_int8()`, `xml_get_xpath_st()`, `xml_get_xpath_uint16()`, `xml_get_xpath_uint32()`, `xml_get_xpath_uint64()`, and `xml_get_xpath_uint8()`.

5.73.1.10 `int ns_length_int (chr_t *s)`

Return the length of a null-terminated string as an int, capped at INT_MAX.

Parameters:

s the null-terminated string to be evaluated.

Returns:

the length of the string.

Definition at line 51 of file nuller.c.

References `log_pedantic`, and `ns_length_get()`.

Referenced by `lib_load_bzip()`.

5.73.1.11 `bool_t ns_populated_variadic (ssize_t len, ...)`

A simple method for checking multiple NULL terminated strings to ensure all of the provided pointers lead to a buffer with at least one non-NULL character.

Parameters:

len the number of pointers being passed in.

va_list the list of NULL terminated string pointers to validate.

Returns:

true if none of the pointers are NULL, and all point to at least one non-NULL byte, otherwise false.

Definition at line 115 of file nuller.c.

5.73.1.12 `void ns_wipe (chr_t * s, size_t len)`

Zero out a null-terminated string.

Parameters:

s the string to be wiped.

len the number of bytes to be wiped at the start of the string.

Returns:

This function returns no parameters.

Definition at line 246 of file nuller.c.

References `log_pedantic`, and `mm_set()`.

Referenced by `deprecated_ecies_key_private_hex()`, `ecies_key_private_hex()`, and `ns_alloc()`.

5.74 src/core/strings/opts.c File Reference

```
#include "magma.h"
```

Functions

- `uint32_t st_opt_get (stringer_t *s)`
Returns the options variable from a string to the caller. Is intended for use by functions outside of string library.
- `int_t st_opt_set (stringer_t *s, uint32_t opt, bool_t enabled)`
Enable or disable a set of option(s) for a managed string, with validity testing.
- `bool_t st_opt_test (stringer_t *s, uint32_t opt)`
Check to see if the managed string has the specified option enabled.

5.74.1 Function Documentation

5.74.1.1 uint32_t st_opt_get (stringer_t * s)

Returns the options variable from a string to the caller. Is intended for use by functions outside of string library. [opts.c](#)

Parameters:

s the input string.

Returns:

the options in use by the provided string.

Definition at line 15 of file `opts.c`.

Referenced by `aes_artifact_decrypt()`, `aes_artifact_encrypt()`, `aes_chunk_decrypt()`, `aes_chunk_encrypt()`, `chunk_header_write()`, `ed25519_private_get()`, `ed25519_public_get()`, `ed25519_sign()`, `meta_data_fetch_shard()`, `org_key_get()`, `org_signet_get()`, `prime_field_write()`, `prime_header_write()`, `rand_choices()`, `secp256k1_compute_kek()`, `secp256k1_private_get()`, `secp256k1_public_get()`, `st_write_variadic()`, `stacie_create_nonce()`, `stacie_create_salt()`, `stacie_create_shard()`, `user_key_get()`, `user_request_get()`, and `user_signet_get()`.

5.74.1.2 int_t st_opt_set (stringer_t * s, uint32_t opt, bool_t enabled)

Enable or disable a set of option(s) for a managed string, with validity testing.

Parameters:

- s* the input managed string.
- opt* the bitmask of option(s) to be enabled or disabled for the managed string.
- enabled* if true, set the option(s); if false, disable them.

Returns:

-1 on error, 0 if successfully disabled, or 1 if successfully enabled.

Definition at line 33 of file `opts.c`.

References `log_pedantic`, `MEMORYBUF`, `st_info_opts()`, and `st_valid_opts()`.

Referenced by `contact_name()`.

5.74.1.3 bool_t st_opt_test (stringer_t * s, uint32_t *opt*)

Check to see if the managed string has the specified option enabled.

Parameters:

s the managed string to be checked. *opt* a bitmask of the managed string options to be tested.

Returns:

-1 on error, 0 if *opt* is not set, and 1 if *opt* is set.

Definition at line 64 of file `opts.c`.

References `log_pedantic`, `MEMORYBUF`, `st_info_opts()`, and `st_valid_opts()`.

Referenced by `contact_free()`, and `contact_name()`.

5.75 src/core/strings/print.c File Reference

```
#include "magma.h"
```

Functions

- `size_t st_vsprint (stringer_t *s, chr_t *format, va_list args)`
Print to a managed string and return the number of bytes written.
- `size_t st_sprint (stringer_t *s, chr_t *format,...)`
Print to a managed string and return the number of bytes written.
- `stringer_t * st_quick (stringer_t *s, chr_t *format,...)`
Print to a managed string and return a pointer to the result.
- `stringer_t * st_vaprint_opts (uint32_t opts, chr_t *format, va_list args)`
Return a managed string containing sprintf()-style formatted data.
- `stringer_t * st_aprint (chr_t *format,...)`
Return a managed string containing sprintf()-style formatted data.
- `stringer_t * st_aprint_opts (uint32_t opts, chr_t *format,...)`
Return a managed string containing sprintf()-style formatted data, with custom allocation options.
- `int_t st_write_variadic (stringer_t *output, ssize_t count,...)`
Write a variable number of user-supplied strings into a buffer.

5.75.1 Function Documentation

5.75.1.1 stringer_t* st_aprint (chr_t *format, ...)

Return a managed string containing sprintf()-style formatted data.

See also:

[st_vaprint_opts\(\)](#)

Parameters:

- format* a format string for the output string data.
- ...* a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string containing the final formatted data on success.

Definition at line 145 of file print.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_vaprint_opts().

Referenced by portal_endpoint_attachments_progress(), portal_endpoint_search(), portal_message_attachments(), register_captcha_random_font(), serial_get(), serial_increment(), serial_reset(), and spool_mktemp().

5.75.1.2 `stringer_t* st_aprint_opts (uint32_t opts, chr_t *format, ...)`

Return a managed string containing sprintf()-style formatted data, with custom allocation options.

Parameters:

opts the option value of the newly allocated managed string that will contain the result.

format a format string for the output string data.

... a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string of the specified allocation options containing the final formatted data on success.

Definition at line 164 of file print.c.

References `st_vaprint_opts()`.

Referenced by `http_response_cookie()`, `imap_fetch_message()`, and `imap_search()`.

5.75.1.3 `stringer_t* st_quick (stringer_t *s, chr_t *format, ...)`

Print to a managed string and return a pointer to the result.

See also:

`st_print()`

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

... a variable argument list containing the parameters to the print format string.

Returns:

a pointer to the managed string that received the printed output.

Definition at line 82 of file print.c.

References `st_vsprintf()`.

Referenced by `api_endpoint_auth()`, `http_response_allow_cross()`, `http_response_cookie()`, `imap_login()`, `pop_pass()`, `portal_endpoint_auth()`, `smtp_auth_login()`, `smtp_auth_plain()`, and `smtp_client_send_data()`.

5.75.1.4 `size_t st_sprint (stringer_t *s, chr_t *format, ...)`

Print to a managed string and return the number of bytes written.

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

... a variable argument list containing the parameters to the print format string.

Returns:

-1 on failure, or the number of characters printed to the string, excluding the terminating null byte.

Definition at line 62 of file print.c.

References `st_vsprintf()`.

Referenced by `contact_abuse_checks()`, `contact_abuse_increment_history()`, `host_platform()`, `host_version()`, `imap_id()`, `imap_search()`, `ip_reversed()`, `ip_standard()`, `ip_subnet()`, `lock_get()`, `lock_release()`, `mail_build_signature()`, `register_data_insert_user()`, `smtp_bounce()`, `smtp_check_greylist()`, `smtp_reply()`, `tls_cipher()`, `tls_error()`, `user_lock()`, and `user_unlock()`.

5.75.1.5 `stringer_t* st_vaprint_opts (uint32_t opts, chr_t *format, va_list args)`

Return a managed string containing `sprintf()`-style formatted data.

Parameters:

opts an options value to be passed to the allocation of the resulting managed string.

format a format string for the output string data.

args a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string containing the final formatted data on success.

Definition at line 100 of file print.c.

References `length`, `log_pedantic`, `MEMORYBUF`, `st_alloc_opts()`, `st_data_get()`, `st_free()`, `st_info_opts()`, `st_length_set()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `st_aprint()`, and `st_aprint_opts()`.

5.75.1.6 `size_t st_vsprintf (stringer_t *s, chr_t *format, va_list args)`

Print to a managed string and return the number of bytes written.

See also:

`vsnprintf()`

Note:

If the destination string pointer is NULL the function will simply return how much room would have been necessary.

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

args a `va_list` containing the parameters to the print format string.

Returns:

-1 on failure, or the number of characters printed to the string, excluding the terminating null byte.

Definition at line 19 of file print.c.

References `length`, `log_pedantic`, `MEMORYBUF`, `st_avail_get()`, `st_data_get()`, `st_info_opts()`, `st_length_set()`, `st_valid_destination()`, and `st_valid_tracked()`.

Referenced by `st_quick()`, and `st_sprint()`.

5.75.1.7 `int_t st_write_variadic (stringer_t * output, ssize_t count, ...)`

Write a variable number of user-supplied strings into a buffer.

Parameters:

... a variable argument list containing the strings to be written one after the other.

Returns:

the number of bytes written into the buffer.

Definition at line 182 of file `print.c`.

References `data`, `mm_copy()`, `st_avail_get()`, `st_data_get()`, `st_empty_out()`, `st_length_set()`, `st_opt_get()`, and `st_valid_tracked()`.

5.77.1.5 `bool_t pl_inc (placer_t * place, bool_t more)`

Advance the placer one character forward beyond an expected character.

Parameters:

place the input placer.

more if true, the placer must contain more data, and vice versa.

Returns:

true if more was true and the placer contains more data, or if more was false and the placer ended; false otherwise.

Definition at line 114 of file shortcuts.c.

References `pl_empty()`.

5.77.1.6 `placer_t pl_init (void * data, size_t len)`

Return a placer wrapping a data buffer of given size.

Parameters:

data a pointer to the data to be wrapped.

len the length, in bytes, of the data.

Returns:

a placer pointing to the specified data.

Definition at line 25 of file shortcuts.c.

5.77.1.7 `size_t pl_length_get (placer_t place)`

Get the length, in bytes, of a placer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 74 of file shortcuts.c.

References `st_length_get()`.

5.77.1.10 `placer_t pl_set (placer_t place, placer_t set)`

Definition at line 34 of file `shortcuts.c`.

References `placer_t`.

Referenced by `mail_mime_split()`.

5.77.1.11 bool_t pl_starts_with_char (placer_t *place*, chr_t *c*)

Determine if a placer begins with a specified character.

Parameters:

place the input placer.

c the character to be compared with the first byte of the placer's data.

Returns:

true if the placer begins with the given character or false otherwise.

Definition at line 95 of file shortcuts.c.

References `pl_char_get()`, and `pl_empty()`.

Referenced by `nvp_parse()`, `prime_pem_unwrap()`, and `smtp_client_send_data()`.

Functions

- `struct __attribute__((packed))`
- `chr_t * ns_alloc (size_t len)`
nuller.c
- `chr_t * ns_append (chr_t *s, chr_t *append)`
Append one string to another and return the result.
- `chr_t * ns_dupe (chr_t *s)`
Duplicate a null-terminated string.
- `bool_t ns_empty (chr_t *s)`
Return whether a null-terminated string is empty or not.
- `bool_t ns_empty_out (chr_t *s, chr_t **ptr, size_t *len)`
Return whether a null-terminated string is empty or not, while storing its address and length.
- `void ns_free (chr_t *s)`
Free a null-terminated string.
- `bool_t ns_populated_variadic (ssize_t len,...)`
A simple method for checking multiple NULL terminated strings to ensure all of the provided pointers lead to a buffer with at least one non-NULL character.
- `void ns_cleanup_variadic (ssize_t len,...)`
A checked cleanup function which can be used free a variable number of null-terminated strings.
- `chr_t * ns_import (void *block, size_t len)`
Get a block of memory as a null-terminated string.
- `size_t ns_length_get (const chr_t *s)`
Return the length of a null-terminated string.
- `int ns_length_int (chr_t *s)`
Return the length of a null-terminated string as an int, capped at INT_MAX.
- `void ns_wipe (chr_t *s, size_t len)`
Zero out a null-terminated string.
- `const chr_t * st_info_type (uint32_t opts)`
Get a readable description of a managed string's data type.
- `const chr_t * st_info_layout (uint32_t opts)`
Get a readable description of a managed string's data layout.
- `const chr_t * st_info_allocator (uint32_t opts)`
Get a readable description of a managed string's allocator type.
- `chr_t * st_info_opts (uint32_t opts, chr_t *s, size_t len)`
Get a readable description of all of a managed string's option flags.
- `bool_t st_valid_free (uint32_t opts)`

Determine whether a managed string is allowed to be freed.

- `bool_t st_valid_opts` (uint32_t opts)

Check to see that a managed string has a valid combination of allocation options.

- `bool_t st_valid_avail` (uint32_t opts)

Determine whether a managed string tracks the total allocated buffer size.

- `bool_t st_valid_append` (uint32_t opts)

Determine whether the managed string options allow for data appending.

- `bool_t st_valid_placer` (uint32_t opts)

A sanity check to determine whether the managed string is a valid placer.

- `bool_t st_valid_jointed` (uint32_t opts)

Determine whether the managed string options are a validly jointed.

- `bool_t st_valid_tracked` (uint32_t opts)

Determine whether a managed string provides for data length tracking.

- `bool_t st_valid_destination` (uint32_t opts)

Determine whether the managed string options allow for a data store operation.

- `int_t st_length_int` (stringer_t *s)

Length.

- `size_t st_avail_get` (stringer_t *s)

Return the total data buffer size allocated for a managed string.

- `size_t st_length_get` (stringer_t *s)

Return the length of the data in a managed string.

- `size_t st_avail_set` (stringer_t *s, size_t avail)

Set the total data buffer size allocated for a managed string.

- `size_t st_length_set` (stringer_t *s, size_t len)

Set the data length for a managed string that supports data length tracking.

- `chr_t * st_char_get` (stringer_t *s)

data.c

- `void * st_data_get` (stringer_t *s)

Retrieve the data associated with a managed string.

- `void st_data_set` (stringer_t *s, void *data)

Set the underlying data of a jointed managed string.

- `bool_t st_empty_out` (stringer_t *s, uchr_t **ptr, size_t *len)

Determine whether the specified managed string is empty or not, and store its underlying data and data length.

- `bool_t st_empty_variadic` (ssize_t len,...)

A simple method for checking multiple managed strings to see if any are empty.

- [bool_t st_populated_variadic](#) (ssize_t len,...)
A simple method for checking multiple managed strings to ensure all of the provided strings have contain at least one character of data.
- [bool_t st_used_variadic](#) (ssize_t len,...)
- [uchar_t * st_uchar_get](#) (stringer_t *s)
Retrieve an unsigned character pointer to a managed string's data buffer.
- void [st_wipe](#) (stringer_t *s)
Wipe all of a managed string's allocated memory and if applicable, reset its length.
- [stringer_t * st_set](#) (stringer_t *s, uint8_t set, size_t len)
Sets a block of memory to a specified value.
- void [st_free](#) (stringer_t *s)
Free a managed string.
- void [st_cleanup_variadic](#) (ssize_t len,...)
A checked cleanup function which can be used free a variable number managed strings.
- [stringer_t * st_alloc](#) (size_t len)
Allocate a managed string with a specified options mask.
- [stringer_t * st_dupe](#) (stringer_t *s)
Duplicate a managed string.
- [stringer_t * st_import](#) (const void *s, size_t len)
Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.
- [stringer_t * st_copy_in](#) (stringer_t *s, void *buf, size_t len)
Copy data into a managed string.
- [stringer_t * st_realloc](#) (stringer_t *s, size_t len)
Reallocate a managed string to a specified size.
- [stringer_t * st_output](#) (stringer_t *output, size_t len)
Return a suitable managed string to store data of a specified length.
- [stringer_t * st_nullify](#) (chr_t *input, size_t len)
Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.
- [stringer_t * st_import_opts](#) (uint32_t opts, const void *s, size_t len)
Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.
- [stringer_t * st_alloc_opts](#) (uint32_t opts, size_t len)
Allocate a managed string with a specified options mask.
- [stringer_t * st_dupe_opts](#) (uint32_t opts, stringer_t *s)
Create a duplicate copy of a managed string with a specified set of allocation options.
- [stringer_t * st_merge_opts](#) (uint32_t opts, chr_t *format,...)
Concatenate a variable number of user-supplied multi-type strings.
- [stringer_t * st_append_opts](#) (size_t align, stringer_t *s, stringer_t *append)

Append one managed string to another, with aligned memory boundaries.

- `int_t st_append_out` (`size_t align`, `stringer_t **s`, `stringer_t *append`)
- `chr_t * pl_char_get` (`placer_t place`)

shortcuts.c

- `void * pl_data_get` (`placer_t place`)

Get a pointer to the data referenced by a placer.

- `bool_t pl_empty` (`placer_t place`)

Determine whether or not the specified placer is empty.

- `placer_t pl_init` (`void *data`, `size_t len`)

Return a placer wrapping a data buffer of given size.

- `placer_t pl_clone` (`placer_t place`)
- `size_t pl_length_get` (`placer_t place`)

Get the length, in bytes, of a placer.

- `int_t pl_length_int` (`placer_t place`)

Get the length, in bytes, of a placer as an integer.

- `placer_t pl_null` (`void`)

Return a zero-length placer pointing to NULL data.

- `placer_t pl_set` (`placer_t place`, `placer_t set`)
- `bool_t pl_starts_with_char` (`placer_t place`, `chr_t c`)

Determine if a placer begins with a specified character.

- `bool_t pl_inc` (`placer_t *place`, `bool_t more`)

Advance the placer one character forward beyond an expected character.

- `uint32_t st_opt_get` (`stringer_t *s`)

opts.c

- `bool_t st_opt_test` (`stringer_t *s`, `uint32_t opt`)

Check to see if the managed string has the specified option enabled.

- `int_t st_opt_set` (`stringer_t *s`, `uint32_t opt`, `bool_t enabled`)

Enable or disable a set of option(s) for a managed string, with validity testing.

- `stringer_t * st_aprint` (`chr_t *format`,...) `__attribute__((format(printf`

print.c

- `stringer_t stringer_t * st_aprint_opts` (`uint32_t opts`, `chr_t *format`,...) `__attribute__((format(printf`
- `stringer_t stringer_t stringer_t * st_quick` (`stringer_t *s`, `chr_t *format`,...) `__attribute__((format(printf`
- `stringer_t stringer_t stringer_t size_t st_sprint` (`stringer_t *s`, `chr_t *format`,...) `__attribute__((format(printf`
- `stringer_t stringer_t stringer_t size_t st_vaprint_opts` (`uint32_t opts`, `chr_t *format`, `va_list args`)

Return a managed string containing sprintf()-style formatted data.

- `size_t st_vsprint` (`stringer_t *s`, `chr_t *format`, `va_list args`)

Print to a managed string and return the number of bytes written.

- `int_t st_write_variadic` (`stringer_t` *output, `ssize_t` count,...)
Write a variable number of user-supplied strings into a buffer.
- `int_t st_replace` (`stringer_t` **target, `stringer_t` *pattern, `stringer_t` *replacement)
replace.c
- `stringer_t * st_swap` (`stringer_t` *target, `uchr_t` pattern, `uchr_t` replacement)
Replace all instances of one character in a managed string with another.
- `int32_t cmp_mt_mt` (`multi_t` one, `multi_t` two)
multi.c
- `bool_t ident_mt_mt` (`multi_t` one, `multi_t` two)
Check to see if the values of two multi-type objects are identical.
- `multi_t mt_dupe` (`multi_t` multi)
Duplicate a multi-type object.
- `void mt_free` (`multi_t` multi)
Free the data underlying a multi-type data object (for managed and null-terminated strings).
- `char * mt_get_char` (const `multi_t` *multi)
Get a character pointer to the value of a multi-type object.
- `size_t mt_get_length` (`multi_t` multi)
Get the length of the data associated with a multi-type object.
- `multi_t mt_get_null` (void)
Return an empty multi-type object.
- `uint64_t mt_get_number` (`multi_t` multi)
Get the value of a numerical multi-type object.
- `M_TYPE mt_get_type` (`multi_t` multi)
Get the data type associated with a multi-type object.
- `bool_t mt_is_empty` (`multi_t` multi)
Determine whether a multi-type object is empty.
- `bool_t mt_is_number` (`multi_t` multi)
Determine whether a multi-type object is a number.
- `multi_t mt_set_type` (`multi_t` multi, `M_TYPE` target)
Set the data type of a multi-type data object.

Variables

- `constant_t`
- `nuller_t`
- `block_t`
- `placer_t`
- `managed_t`
- `mapped_t`

References data, and length.

5.78.4.2 `int32_t cmp_mt_mt (multi_t one, multi_t two)`

[multi.c](#) [multi.c](#)

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

- one* the first multi-type object to be compared.
- two* the second multi-type object to be compared.

Returns:

Definition at line 682 of file `multi.c`.

Referenced by `tree_cmp()`.

5.78.4.3 `bool_t ident_mt_mt (multi_t one, multi_t two)`

Check to see if the values of two multi-type objects are identical.

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

- one* the first multi-type object to be compared.
- two* the second multi-type object to be compared.

Returns:

true if the two objects have identical values; false if they don't, or on failure.

Definition at line 567 of file `multi.c`.

References `multi_t::binary`, `multi_t::dbl`, `multi_t::fl`, `multi_t::i16`, `multi_t::i32`, `multi_t::i64`, `multi_t::i8`, `log_options`, `log_pedantic`, `M_LOG_PEDANTIC`, `M_LOG_STACK_TRACE`, `M_TYPE_BOOLEAN`, `M_TYPE_DOUBLE`, `M_TYPE_FLOAT`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `mt_get_type()`, `multi_t::ns`, `ns_length_get()`, `PLACER`, `multi_t::st`, `st_cmp_cs_eq()`, `multi_t::type`, `multi_t::u16`, `multi_t::u32`, `multi_t::u64`, `multi_t::u8`, and `multi_t::val`.

5.78.4.4 `multi_t mt_dupe (multi_t multi)`

Duplicate a multi-type object.

Parameters:

- multi* the multi-type object to be examined.

Returns:

a copy of the input object (a deep copy for managed strings and null-terminated strings).

Definition at line 484 of file multi.c.

References multi_t::binary, CONTIGUOUS, multi_t::dbl, multi_t::fl, HEAP, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, mt_get_null(), multi_t::ns, ns_dupe(), multi_t::st, st_dupe_opts(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket_alloc(), linked_record_alloc(), and tree_insert().

5.78.4.5 void mt_free (multi_t multi)

Free the data underlying a multi-type data object (for managed and null-terminated strings).

Parameters:

multi the multi-type object to be freed.

Returns:

This function returns no value.

Definition at line 462 of file multi.c.

References M_TYPE_NULLER, M_TYPE_STRINGER, multi_t::ns, ns_free(), multi_t::st, st_free(), multi_t::type, and multi_t::val.

Referenced by hashed_delete(), hashed_free(), hashed_truncate(), linked_record_free(), tree_delete(), tree_insert(), and tree_truncate().

5.78.4.6 char* mt_get_char (const multi_t * multi)

Get a character pointer to the value of a multi-type object.

Parameters:

multi a pointer to the multi-type object to be examined.

a pointer to the value of the input object, or NULL on failure.

Returns:

null on error

Definition at line 172 of file multi.c.

References multi_t::binary, multi_t::bl, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, M_LOG_INFO, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, multi_t::st, st_char_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket().

5.78.4.7 size_t mt_get_length (multi_t multi)

Get the length of the data associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the length in bytes of the data associated with the input object, or 0 on failure.

Definition at line 249 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_length_get(), multi_t::st, st_length_get(), type(), multi_t::type, and multi_t::val.

Referenced by hashed_bucket().

5.78.4.8 multi_t mt_get_null (void)

Return an empty multi-type object.

Returns:

an empty multi-type object.

Definition at line 17 of file multi.c.

References EMPTY, and multi_t::type.

Referenced by hashed_cursor_key_active(), hashed_cursor_key_next(), inx_cursor_key_active(), inx_cursor_key_next(), linked_cursor_key_active(), linked_cursor_key_next(), linked_record_get_key(), mt_dupe(), tree_cursor_key_next(), and tree_cursor_next().

5.78.4.9 uint64_t mt_get_number (multi_t multi)

Get the value of a numerical multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the numerical value of the input object, or 0 on failure.

Definition at line 116 of file multi.c.

References multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket().

5.78.4.10 M_TYPE mt_get_type (multi_t multi)

Get the data type associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the data type of the input object, or EMPTY on failure.

Definition at line 318 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by cmp_mt_mt(), and ident_mt_mt().

5.78.4.11 bool_t mt_is_empty (multi_t multi)

Determine whether a multi-type object is empty.

Note:

All numeric (including boolean and floating point) types will always return false.

Parameters:

multi the multi-type object to be examined.

Returns:

true if the object is empty (by type or value), or false otherwise.

Definition at line 31 of file multi.c.

References multi_t::bl, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_empty(), multi_t::st, st_empty, type(), multi_t::type, and multi_t::val.

Referenced by config_load_cmdline_settings(), config_load_file_settings(), and tree_insert().

5.78.4.12 bool_t mt_is_number (multi_t multi)

Determine whether a multi-type object is a number.

Parameters:

multi the multi-type object to be examined. return true if the input object is any integer, boolean, or floating point; false otherwise.

Definition at line 80 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by hashed_bucket().

5.78.4.13 multi_t mt_set_type (multi_t multi, M_TYPE target)

Set the data type of a multi-type data object.

Parameters:

multi the multi-type object to be adjusted.

target the value of the new data type for the input object.

Returns:

a copy of the modified multi-type data object.

Definition at line 391 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by nvp_parse().

5.78.4.14 chr_t* ns_alloc (size_t len)

[nuller.c](#) [nuller.c](#)

Parameters:

len the length of the buffer to be allocated.

Returns:

NULL on failure or if len was 0; a pointer to the newly allocated memory otherwise.

Definition at line 68 of file nuller.c.

References log_pedantic, mm_alloc(), and ns_wipe().

Referenced by deserialize_ns(), mail_message_path(), and ns_append().

5.78.4.15 chr_t* ns_append (chr_t * s, chr_t * append)

Append one string to another and return the result.

Parameters:

s a pointer to a leading null-terminated string to to which the other string will be appended.

append a pointer to a null-terminated string to be appended to the leading string.

Returns:

NULL if a memory allocation failure occurred, or a pointer to the resulting string on success.

Definition at line 211 of file nuller.c.

References log_pedantic, mm_copy(), ns_alloc(), ns_dupe(), ns_free(), and ns_length_get().

Referenced by api_response(), portal_endpoint_error(), and portal_endpoint_response().

5.78.4.16 void ns_cleanup_variadic (ssize_t len, ...)

A checked cleanup function which can be used free a variable number of null-terminated strings.

See also:

[ns_free\(\)](#)

Parameters:

va_list a list of null-terminated strings to be freed.

Returns:

This function returns no value.

Definition at line 146 of file nuller.c.

References ns_free().

5.78.4.17 chr_t* ns_dup (chr_t * s)

Duplicate a null-terminated string.

Parameters:

s the null-terminated string to be duplicated.

Returns:

NULL on failure, or a pointer to a copy of the input string.

Definition at line 167 of file nuller.c.

References length, log_info, log_pedantic, mm_alloc(), mm_copy(), and ns_length_get().

Referenced by cache_set_value(), config_value_set(), mt_dup(), ns_append(), relay_set_value(), servers_set_value(), and xml_get_xpath_ns().

5.78.4.18 bool_t ns_empty (chr_t * s)

Return whether a null-terminated string is empty or not.

Parameters:

s the input as a null-terminated string.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 29 of file nuller.c.

References ns_length_get().

Referenced by cache_free(), cache_output_settings(), cache_set_value(), cache_validate(), config_output_value(), config_output_value_generic(), config_value_set(), dkim_signature_create(), lib_load(), mail_mime_get_media_type(), mt_is_empty(), relay_free(), relay_output_settings(), relay_set_value(), relay_validate(), servers_free(), servers_output_settings(), servers_set_value(), servers_validate(), sql_start(), and st_merge_opts().

5.78.4.19 bool_t ns_empty_out (chr_t * s, chr_t ** ptr, size_t * len)

Return whether a null-terminated string is empty or not, while storing its address and length.

Parameters:

s the input as a null-terminated string.

ptr a pointer address to receive a copy of the string's location.

len a pointer to a variable to receive the length of the string, in bytes.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 41 of file nuller.c.

References ns_length_get().

5.78.4.20 void ns_free (chr_t * s)

Free a null-terminated string.

Parameters:

s the string to be freed.

Returns:

This function returns no value.

Definition at line 95 of file nuller.c.

References log_pedantic, and mm_free().

Referenced by api_response(), cache_free(), cache_set_value(), config_free(), config_value_set(), ip_subnet_st(), mail_copy_message(), mail_load_message(), mail_message_path(), mail_remove_message(), mail_store_message(), mail_store_message_data(), mt_free(), ns_append(), ns_cleanup_variadic(), portal_endpoint_error(), portal_endpoint_response(), relay_free(), relay_set_value(), servers_free(), and servers_set_value().

5.78.4.21 chr_t* ns_import (void * block, size_t len)

Get a block of memory as a null-terminated string.

Parameters:

block a pointer to the buffer containing the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

NULL on failure, or a pointer to the newly allocated null-terminated string on success.

Definition at line 192 of file nuller.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by cache_set_value(), config_value_set(), ip_subnet_st(), relay_set_value(), and servers_set_value().

5.78.4.22 size_t ns_length_get (const chr_t * s)

Return the length of a null-terminated string. LOW: The ns_ functions are designed to work with NULL terminated strings. They shouldn't require a length. If the length needs to be provided, then the equivalent mm_ function should be used.

Parameters:

s the input as a null-terminatd string.

Returns:

the length in bytes of the string.

Definition at line 18 of file nuller.c.

Referenced by `api_endpoint_delete_user()`, `api_endpoint_register()`, `api_response()`, `build_version_major()`, `build_version_minor()`, `build_version_patch()`, `con_reverse_lookup()`, `con_write_ns()`, `config_fetch_host_number()`, `config_fetch_settings()`, `deprecated_ecies_key_private_hex()`, `deprecated_ecies_key_public_hex()`, `ecies_key_private_hex()`, `ecies_key_public_hex()`, `file_temp_handle()`, `host_platform()`, `host_version()`, `http_load_file()`, `ident_mt_mt()`, `imap_build_array()`, `imap_fetch_bodystructure()`, `imap_fetch_message()`, `imap_search_messages_date()`, `int16_conv_ns()`, `int32_conv_ns()`, `int64_conv_ns()`, `int8_conv_ns()`, `ip_addr_st()`, `ip_presentation()`, `ip_subnet_st()`, `lib_load_openssl()`, `line_pl_ns()`, `log_rotate()`, `log_start()`, `mail_mime_get_media_type()`, `mail_path_finder()`, `meta_folders_name()`, `mt_get_length()`, `ns_append()`, `ns_dupe()`, `ns_empty()`, `ns_empty_out()`, `ns_length_int()`, `portal_endpoint()`, `portal_endpoint_attachments_add()`, `portal_endpoint_error()`, `portal_endpoint_folders_add()`, `portal_endpoint_folders_rename()`, `portal_endpoint_response()`, `portal_parse_json_str_array()`, `rand_choices()`, `register_data_insert_user()`, `register_print_step1()`, `register_print_step2()`, `servers_network_start()`, `smtp_client_send_helo()`, `spool_path()`, `st_merge_opts()`, `stmt_rebuild()`, `stmt_start()`, `tank_start()`, `teacher_add_cookie()`, `uint16_conv_ns()`, `uint32_conv_ns()`, `uint64_conv_ns()`, `uint8_conv_ns()`, `virus_check()`, `xml_get_xpath_int16()`, `xml_get_xpath_int32()`, `xml_get_xpath_int64()`, `xml_get_xpath_int8()`, `xml_get_xpath_st()`, `xml_get_xpath_uint16()`, `xml_get_xpath_uint32()`, `xml_get_xpath_uint64()`, and `xml_get_xpath_uint8()`.

5.78.4.23 int ns_length_int (chr_t * s)

Return the length of a null-terminated string as an int, capped at INT_MAX.

Parameters:

s the null-terminated string to be evaluated.

Returns:

the length of the string.

Definition at line 51 of file nuller.c.

References `log_pedantic`, and `ns_length_get()`.

Referenced by `lib_load_bzip()`.

5.78.4.24 bool_t ns_populated_variadic (ssize_t len, ...)

A simple method for checking multiple NULL terminated strings to ensure all of the provided pointers lead to a buffer with at least one non-NULL character.

Parameters:

len the number of pointers being passed in.

va_list the list of NULL terminated string pointers to validate.

Returns:

true if none of the pointers are NULL, and all point to at least one non-NULL byte, otherwise false.

Definition at line 115 of file nuller.c.

5.78.4.25 void ns_wipe (chr_t * s, size_t len)

Zero out a null-terminated string.

Parameters:

s the string to be wiped.

len the number of bytes to be wiped at the start of the string.

Returns:

This function returns no parameters.

Definition at line 246 of file nuller.c.

References `log_pedantic`, and `mm_set()`.

Referenced by `deprecated_ecies_key_private_hex()`, `ecies_key_private_hex()`, and `ns_alloc()`.

5.78.4.26 `chr_t* pl_char_get (placer_t place)`

[shortcuts.c shortcuts.c](#)

Parameters:

place the input placer.

Returns:

NULL on failure or a character pointer to the block of data associated with the specified placer on success.

Definition at line 54 of file shortcuts.c.

References `st_char_get()`.

Referenced by `cache_config()`, `con_write_pl()`, `deprecated_ecies_key_private()`, `deprecated_ecies_key_public()`, `dmtpl_process()`, `ecies_key_private()`, `ecies_key_public()`, `imap_fetch_body_header()`, `imap_narrow_messages()`, `imap_search_messages_range()`, `ip_subnet_st()`, `lib_load_openssl()`, `line_pl_pl()`, `molten_parse()`, `nvp_parse()`, `pl_get_embraced()`, `pl_shrink_before_characters()`, `pl_skip_characters()`, `pl_skip_to_characters()`, `pl_starts_with_char()`, `pl_trim()`, `pl_trim_end()`, `pl_trim_start()`, `pop_process()`, `portal_message_body()`, `portal_upload()`, `relay_config()`, `servers_config()`, `smtp_auth_login()`, `smtp_auth_plain()`, `smtp_client_send_data()`, `smtp_parse_helo_domain()`, `smtp_parse_mail_from_path()`, `smtp_parse_rcpt_to()`, `smtp_process()`, and `str_tok_get_bl()`.

5.78.4.27 `placer_t pl_clone (placer_t place)`

Definition at line 30 of file shortcuts.c.

References `pl_init()`.

Referenced by `prime_pem_unwrap()`.

5.78.4.28 `void* pl_data_get (placer_t place)`

Get a pointer to the data referenced by a placer.

Parameters:

place the input placer.

Returns:

NULL on failure or a pointer to the block of data associated with the specified placer on success.

Definition at line 44 of file shortcuts.c.

References `st_data_get()`.

Referenced by `aes_artifact_decrypt()`, `aes_artifact_encrypt()`, `aes_chunk_decrypt()`, `aes_chunk_encrypt()`, `deprecated_ecies_key_private()`, `deprecated_ecies_key_public()`, `ecies_key_private()`, `ecies_key_public()`, `ephemeral_chunk_set()`, `imap_build_array()`, `imap_build_array_isliteral()`, `imap_fetch_body()`, `imap_fetch_body_header()`, `imap_folder_create()`, `imap_folder_rename()`, `imap_parse_address_part()`, `nvp_parse()`, `org_signet_set()`, `prime_pem_unwrap()`, `smtp_check_filters()`, `tok_get_pl()`, `uint64_conv_pl()`, `user_request_set()`, and `user_signet_set()`.

5.78.4.29 bool_t pl_empty (placer_t *place*)

Determine whether or not the specified placer is empty.

Parameters:

place the input placer.

Returns:

true if the placer is empty or zero-length, or false otherwise.

Definition at line 84 of file shortcuts.c.

References st_empty.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), cache_config(), client_read_line(), con_read_line(), dmtip_process(), http_data_value_parse(), http_process(), imap_build_array(), imap_build_array_isliteral(), imap_fetch_body(), imap_fetch_body_header(), imap_narrow_messages(), imap_parse_address(), imap_parse_literal(), imap_process(), imap_search_messages_date(), imap_search_messages_header(), imap_search_messages_range(), mail_add_forward_headers(), mail_add_outbound_headers(), mail_mime_child(), mail_mime_count(), mail_mod_subject(), molten_parse(), multipart_get_boundary(), nvp_parse(), pl_get_embraced(), pl_inc(), pl_shrink_before_characters(), pl_skip_characters(), pl_skip_to_characters(), pl_starts_with_char(), pop_process(), portal_upload(), prime_pem_unwrap(), relay_config(), servers_config(), slots_key(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), and smtp_process().

5.78.4.30 bool_t pl_inc (placer_t * *place*, bool_t *more*)

Advance the placer one character forward beyond an expected character.

Parameters:

place the input placer.

more if true, the placer must contain more data, and vice versa.

Returns:

true if more was true and the placer contains more data, or if more was false and the placer ended; false otherwise.

Definition at line 114 of file shortcuts.c.

References pl_empty().

5.78.4.31 placer_t pl_init (void * *data*, size_t *len*)

Return a placer wrapping a data buffer of given size.

Parameters:

data a pointer to the data to be wrapped.

len the length, in bytes, of the data.

Returns:

a placer pointing to the specified data.

Definition at line 25 of file shortcuts.c.

References FOREIGNDATA, JOINTED, PLACER_T, placer_t, and STACK.

5.78.4.32 `size_t pl_length_get (placer_t place)`

Get the length, in bytes, of a placer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 74 of file shortcuts.c.

References `st_length_get()`.

Referenced by `cache_config()`, `chunk_buffer_read()`, `chunk_header_read()`, `client_read()`, `client_read_line()`, `con_read()`, `con_read_line()`, `con_write_pl()`, `deprecated_ecies_key_private()`, `deprecated_ecies_key_public()`, `dmtp_process()`, `ecies_key_private()`, `ecies_key_public()`, `imap_build_array()`, `imap_build_array_isliteral()`, `imap_fetch_body()`, `imap_folder_create()`, `imap_folder_rename()`, `imap_parse_address_part()`, `imap_parse_literal()`, `ip_subnet_st()`, `line_pl_pl()`, `molten_parse()`, `nvp_parse()`, `org_signet_set()`, `pl_shrink_before_characters()`, `pl_trim()`, `pl_trim_end()`, `pl_trim_start()`, `pop_process()`, `portal_message_body()`, `portal_upload()`, `prime_pem_unwrap()`, `relay_config()`, `servers_config()`, `slots_buffer()`, `smtp_auth_login()`, `smtp_auth_plain()`, `smtp_check_filters()`, `smtp_parse_helo_domain()`, `smtp_parse_mail_from_path()`, `smtp_parse_rcpt_to()`, `smtp_process()`, `str_tok_get_bl()`, `str_tok_get_count_bl()`, `tok_get_pl()`, `uint64_conv_pl()`, `user_request_set()`, and `user_signet_set()`.

5.78.4.33 `int_t pl_length_int (placer_t place)`

Get the length, in bytes, of a placer as an integer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 64 of file shortcuts.c.

References `st_length_int()`.

Referenced by `lib_load_openssl()`, `smtp_client_send_data()`, `smtp_parse_helo_domain()`, `smtp_parse_mail_from_path()`, and `smtp_parse_rcpt_to()`.

5.78.4.34 `placer_t pl_null (void)`

Return a zero-length placer pointing to NULL data.

Returns:

a zero-length placer pointing to NULL data.

Definition at line 14 of file shortcuts.c.

References FOREIGNDATA, JOINTED, PLACER_T, placer_t, and STACK.

5.78.4.35 placer_t pl_set (placer_t *place*, placer_t *set*)

Definition at line 34 of file shortcuts.c.

References placer_t.

Referenced by mail_mime_split().

5.78.4.36 bool_t pl_starts_with_char (placer_t *place*, chr_t *c*)

Determine if a placer begins with a specified character.

Parameters:

- place* the input placer.
- c* the character to be compared with the first byte of the placer's data.

Returns:

true if the placer begins with the given character or false otherwise.

Definition at line 95 of file shortcuts.c.

References pl_char_get(), and pl_empty().

Referenced by nvp_parse(), prime_pem_unwrap(), and smtp_client_send_data().

5.78.4.37 stringer_t* st_alloc (size_t *len*)

Allocate a managed string with a specified options mask.

See also:

[st_alloc_opts\(\)](#)

Parameters:

- len* the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 631 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_alloc_opts().

5.78.4.38 `stringer_t* st_alloc_opts (uint32_t opts, size_t len)`

Allocate a managed string with a specified options mask.

See also:

`st_valid_options()`

Note:

All requested allocation masks should conform to the validation imposed by `st_valid_opts()`. The supported types are: `placer`, `nuller`, `block`, `managed`, and `mapped`. The following logic is applied to requested string allocation options: 1. Any allocation options specified for strings to be allocated on the stack are IGNORED. 2. All jointed strings allocate memory for the header and data separately and then link them EXCEPT: Jointed placers only allocate space for a header. Jointed mapped strings allocate the data with an aligned `mmap()` operation. 3. Contiguous strings allocate space for the header and data together in a single contiguous block. 4. After allocation, the length field is set for block strings. 5. After allocation, the available field is set for managed strings. 6. Placers can only be jointed; mapped strings can only be contiguous.

Parameters:

opts the allocation options mask to be used by the newly allocated string.

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 498 of file `allocation.c`.

5.78.4.39 `stringer_t* st_append_opts (size_t align, stringer_t * s, stringer_t * append)`

Append one managed string to another, with aligned memory boundaries.

Parameters:

align an alignment value to be used for managed string (re)allocation. This only works for powers of 2.

s the managed string to be extended, which will be allocated for the caller if passed as NULL.

append the managed string to be appended to *s*.

Returns:

NULL on failure, or a pointer to the appended result on success.

Definition at line 407 of file allocation.c.

5.78.4.46 void st_cleanup_variadic (ssize_t len, ...)

A checked cleanup function which can be used free a variable number managed strings.

See also:

[st_free\(\)](#)

Parameters:

va_list a list of managed strings to be freed.

Returns:

This function returns no value.

Definition at line 96 of file allocation.c.

References [st_free\(\)](#).

5.78.4.47 stringer_t* st_copy_in (stringer_t * s, void * buf, size_t len)

Copy data into a managed string.

Parameters:

- s* the managed string to store the copied contents of the data.
- buf* a pointer to the buffer containing the data to be copied.
- len* the length of the data to be copied.

Returns:

NULL on failure, or a pointer to the managed string on success.

Definition at line 279 of file allocation.c.

References log_pedantic, mm_copy(), st_avail_get(), st_data_get(), and st_length_set().

Referenced by pop_pass_parse().

5.78.4.48 void* st_data_get (stringer_t * s)

Retrieve the data associated with a managed string.

Parameters:

- s* the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 149 of file data.c.

5.78.4.49 void st_data_set (stringer_t * s, void * data)

Set the underlying data of a jointed managed string.

Parameters:

- s* the managed string to be adjusted.
- data* the data buffer to be attached to the input managed string.

Note:

The underlying data of *s* will be released, unless it contains foreign data.

Returns:

This function does not return a value.

Definition at line 92 of file data.c.

References block_t, BLOCK_T, FOREIGNDATA, JOINTED, log_pedantic, managed_t, MANAGED_T, MAPPED_T, MEMORYBUF, mm_free(), mm_sec_free(), mm_sec_secured(), nuller_t, NULLER_T, placer_t, PLACER_T, SECURE, st_info_opts(), and st_valid_jointed().

5.78.4.50 stringer_t* st_dupe (stringer_t * s)

Duplicate a managed string.

See also:

[st_dupe_opts\(\)](#)

Note:

The allocation options of the duplicated string will be the same as that of the source string.

Parameters:

- s* the managed string to be duplicated.

Returns:

NULL on failure, or a copy of the input managed string on success.

Definition at line 393 of file allocation.c.

References st_dupe_opts().

Referenced by ar_dupe(), auth_login(), auth_response(), contact_folder_rename(), file_temp_handle(), http_load_file(), http_print_301(), imap_folder_create(), imap_folder_rename(), imap_login(), mail_add_forward_headers(), mail_add_outbound_headers(), mail_cache_get(), pop_pass(), prime_get(), prime_key_encrypt(), prime_pem_wrap(), register_business_step1(), register_business_step2(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), register_session_get(), smtp_add_recipient(), smtp_data_outbound(), smtp_fetch_inbound(), teacher_process(), and user_request_sign().

5.78.4.51 stringer_t* st_dupe_opts (uint32_t opts, stringer_t * s)

Create a duplicate copy of a managed string with a specified set of allocation options.

See also:

[st_valid_opts\(\)](#)

Note:

Both the source and destination managed strings must have option values that pass `st_valid_opts()`. The following procedure occurs when creating the duplicate managed string: If the destination is a placer, 0 bytes are allocated for the duplicate's underlying data. If the destination is a constant, nuller, or block, its underlying data buffer will be of equal size to the source's data length. If the destination is managed or mapped, and so is the source, its underlying data buffer will be of equal size to the source's available size; but if the source is neither, the underlying data buffer of the destination managed or mapped string will equal the size of the source's data length. A deep copy will be made of the source data to the destination if the destination is NOT a placer.

Parameters:

- opts* the allocation options mask to be used for the newly created managed string.
- s* the target managed string to be duplicated.

Returns:

NULL on failure or a pointer to a copy of the duplicated managed string on success.

Definition at line 319 of file allocation.c.

References BLOCK_T, CONSTANT_T, log_pedantic, MANAGED_T, MAPPED_T, MEMORYBUF, mm_copy(), NULLER_T, PLACER_T, st_alloc_opts(), st_avail_get(), st_data_get(), st_data_set(), st_info_opts(), st_length_get(), st_length_set(), st_valid_opts(), and st_valid_tracked().

5.78.4.52 bool_t st_empty_out (stringer_t * s, uchr_t ** ptr, size_t * len)

Determine whether the specified managed string is empty or not, and store its underlying data and data length.

Parameters:

- s* the input managed string.
- ptr* a pointer to a null-terminated string that will receive the address of the managed string's underlying data.
- len* a pointer to store the size of the managed string's underlying data buffer.

Returns:

true if string is NULL or uninitialized or empty; false otherwise.

Definition at line 76 of file data.c.

5.78.4.53 bool_t st_empty_variadic (ssize_t len, ...)

A simple method for checking multiple managed strings to see if any are empty.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to check for emptiness

Returns:

true if any of the strings are NULL, uninitialized or empty; false if every string has at least one byte of data.

Definition at line 48 of file data.c.

References `st_data_get()`, and `st_length_get()`.

5.78.4.54 void st_free (stringer_t * s)

Free a managed string.

See also:

[st_valid_free\(\)](#), [st_valid_opts\(\)](#)

Note:

Any managed string to be freed should conform with the validity checks enforced by [st_valid_free\(\)](#)/[st_valid_opts\(\)](#) *NO* managed string should be passed to [st_free\(\)](#) if it was allocated on the stack, or contains foreign data. The following logic is carried out depending on the allocation options of the string to be freed: Jointed placer: Free header, if secure or on heap Free underlying data if it is not foreign Jointed nuller: Free header and underlying data Jointed block: Free header and underlying data Jointed managed: Free header and underlying data Jointed mapped: Free the header and (munmap) underlying data Contiguous nuller: Free header (this includes the underlying data because they are already merged) Contiguous block: Free header (this includes the underlying data because they are already merged) Contiguous managed: Free header (this includes the underlying data because they are already merged)

Parameters:

s the managed string to be freed.

Returns:

This function returns no value.

HIGH: Finish this logic out. Stack allocations are skipped, unless they are jointed. In that case the data is freed unless it carries a foreigner flag. Note its possible for a jointed string to have a NULL data reference. We should be picking up on that too. Contiguous heap buffers are just destroyed.

Do we need to differentiate between stack structures, and heap data blocks needing to be freed, or not?

5.78.4.55 stringer_t* st_import (const void *s, size_t len)

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

See also:

[st_import_opts\(\)](#)

Parameters:

- s* the address of the buffer to be duplicated.
- len* the length, in bytes, of the copied buffer.

Returns:

NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 267 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_import_opts().

Referenced by cache_get(), con_reverse_lookup(), deprecated_ecies_key_public_hex(), dspam_check(), ecies_key_public_hex(), file_temp_handle(), http_data_header_parse_line(), http_load_file(), imap_fetch_body(), imap_fetch_body_tag(), imap_fetch_bodystructure(), imap_fetch_message(), imap_fetch_return_header(), imap_parse_astring(), imap_parse_nstring(), imap_search_messages_date(), mail_add_outbound_headers(), mail_add_required_headers(), mail_header_fetch_all(), mail_load_header(), mail_mime_content_encoding(), mail_mime_content_id(), mail_mime_type_group(), mail_mime_type_parameters_key(), mail_mime_type_parameters_value(), mail_mime_type_sub(), meta_folders_name(), nvp_parse(), org_signet_set(), pop_user_parse(), portal_endpoint_attachments_add(), portal_endpoint_folders_add(), portal_endpoint_folders_rename(), portal_endpoint_messages_list(), portal_parse_json_str_array(), portal_upload(), register_captcha_generate(), res_field_string(), servers_network_start(), smtp_parse_auth(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), tank_load(), teacher_add_cookie(), user_request_set(), user_signet_set(), xml_dump_doc(), xml_get_xpath_st(), and xml_node_get_content_st().

5.78.4.56 stringer_t* st_import_opts (uint32_t *opts*, const void * *s*, size_t *len*)

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

Parameters:

opts the options value of the resulting managed string that will be allocated for the caller.

s the address of the buffer to be duplicated.

len the length, in bytes, of the copied buffer.

Returns:

NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 236 of file allocation.c.

References log_pedantic, MEMORYBUF, mm_copy(), st_alloc_opts(), st_data_get(), st_info_opts(), st_length_set(), and st_valid_destination().

Referenced by deprecated_ecies_key_private_hex(), ecies_key_private_hex(), and st_import().

5.78.4.57 const chr_t* st_info_allocator (uint32_t *opts*)

Get a readable description of a managed string's allocator type.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's allocator type.

Definition at line 96 of file info.c.

References HEAP, SECURE, st_option_allocators, and STACK.

Referenced by st_info_opts().

5.78.4.58 const chr_t* st_info_layout (uint32_t *opts*)

Get a readable description of a managed string's data layout.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's data layout.

Definition at line 75 of file info.c.

References CONTIGUOUS, JOINTED, and st_option_layouts.

Referenced by st_info_opts().

5.78.4.59 `chr_t* st_info_opts (uint32_t opts, chr_t * s, size_t len)`

Get a readable description of all of a managed string's option flags.

Parameters:

- opts* a value containing the managed string's option mask.
- s* a pointer to a null-terminated string to receive the options description.
- len* the length, in bytes, of the description output buffer.

Returns:

NULL on failure, or a pointer to the output buffer containing the managed string's options description on success.

LOW: Turn this into a loop.

Definition at line 122 of file info.c.

5.78.4.60 `const chr_t* st_info_type (uint32_t opts)`

Get a readable description of a managed string's data type.

Parameters:

- opts* a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's data type.

Definition at line 42 of file info.c.

References BLOCK_T, CONSTANT_T, MANAGED_T, MAPPED_T, NULLER_T, PLACER_T, and st_option_types.

Referenced by st_info_opts().

5.78.4.61 `size_t st_length_get (stringer_t * s)`

Return the length of the data in a managed string.

Parameters:

- s* the input managed string.

Returns:

0 on failure, or the length of the managed string's data in bytes.

Definition at line 15 of file length.c.

5.78.4.62 `int_t st_length_int (stringer_t * s)`

Length. Return the length of a managed string as an integer.

Parameters:

s the managed string as type `stringer_t *`.

Returns:

the string length as an integer, capped at `INT_MAX`.

Definition at line 70 of file `length.c`.

References `log_pedantic`, `st_length_get()`, and `st_valid_opts()`.

5.78.4.64 stringer_t* st_merge_opts (uint32_t *opts*, chr_t **format*, ...)

Concatenate a variable number of user-supplied multi-type strings.

Parameters:

opts the options value of the resulting managed string that will be allocated for the caller.

format a format string consisting of the characters 's' for specifying that the next variable argument will be a managed string or 'n' if it is a null-terminated string.

... a variable argument list containing the strings to be concatenated to one another.

Returns:

a newly allocated string containing the concatenations of all specified managed and null-terminated strings.

Definition at line 120 of file allocation.c.

References length, log_pedantic, MEMORYBUF, mm_copy(), ns_empty(), ns_length_get(), st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_empty, st_info_opts(), st_length_get(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by mail_add_forward_headers(), mail_add_inbound_headers(), mail_add_outbound_headers(), mail_add_required_headers(), and spool_path().

5.78.4.65 stringer_t* st_nullify (chr_t **input*, size_t *len*)

Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

Parameters:

input a pointer to the data block to be copied.

len the size, in bytes, of the data block to be copied before being terminated with a null byte.

Returns:

NULL on failure, or a pointer to the new null-terminated string on success.

Definition at line 841 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, mm_copy(), st_alloc_opts(), st_data_get(), and st_length_set().

5.78.4.66 `uint32_t st_opt_get (stringer_t * s)`

[opts.c](#) [opts.c](#)

Parameters:

s the input string.

Returns:

the options in use by the provided string.

Definition at line 15 of file `opts.c`.

Referenced by `aes_artifact_decrypt()`, `aes_artifact_encrypt()`, `aes_chunk_decrypt()`, `aes_chunk_encrypt()`, `chunk_header_write()`, `ed25519_private_get()`, `ed25519_public_get()`, `ed25519_sign()`, `meta_data_fetch_shard()`, `org_key_get()`, `org_signet_get()`, `prime_field_write()`, `prime_header_write()`, `rand_choices()`, `secp256k1_compute_kek()`, `secp256k1_private_get()`, `secp256k1_public_get()`, `st_write_variadic()`, `stacie_create_nonce()`, `stacie_create_salt()`, `stacie_create_shard()`, `user_key_get()`, `user_request_get()`, and `user_signet_get()`.

5.78.4.67 `int_t st_opt_set (stringer_t * s, uint32_t opt, bool_t enabled)`

Enable or disable a set of option(s) for a managed string, with validity testing.

Parameters:

s the input managed string.

opt the bitmask of option(s) to be enabled or disabled for the managed string.

enabled if true, set the option(s); if false, disable them.

Returns:

-1 on error, 0 if successfully disabled, or 1 if successfully enabled.

Definition at line 33 of file `opts.c`.

References `log_pedantic`, `MEMORYBUF`, `st_info_opts()`, and `st_valid_opts()`.

Referenced by `contact_name()`.

5.78.4.68 `bool_t st_opt_test (stringer_t * s, uint32_t opt)`

Check to see if the managed string has the specified option enabled.

Parameters:

s the managed string to be checked. *opt* a bitmask of the managed string options to be tested.

Returns:

-1 on error, 0 if *opt* is not set, and 1 if *opt* is set.

Definition at line 64 of file `opts.c`.

References `log_pedantic`, `MEMORYBUF`, `st_info_opts()`, and `st_valid_opts()`.

Referenced by `contact_free()`, and `contact_name()`.

5.78.4.69 stringer_t* st_output (stringer_t * *output*, size_t *len*)

Return a suitable managed string to store data of a specified length.

Note:

If a NULL output string is specified, one will be allocated for the caller.

Parameters:

output the input managed string (can be NULL).

len the size, in bytes, of the requested data buffer.

Returns:

NULL on failure or if input was not large enough or a pointer to a validated output managed string.

Definition at line 812 of file allocation.c.

References log_pedantic, st_alloc(), st_avail_get(), and st_valid_destination().

Referenced by chunk_header_write(), deprecated_symmetric_key(), deprecated_symmetric_vector(), encrypted_chunk_get(), prime_field_write(), prime_header_write(), prime_pem_wrap(), slots_key(), symmetric_key(), symmetric_vector(), tls_cipher(), and tls_error().

5.78.4.70 bool_t st_populated_variadic (ssize_t *len*, ...)

A simple method for checking multiple managed strings to ensure all of the provided strings have contain at least one character of data.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to be validated.

Returns:

true if all of the strings are populated with at least one byte of data, otherwise false.

Definition at line 19 of file data.c.

References st_data_get(), and st_length_get().

5.78.4.71 stringer_t stringer_t stringer_t* st_quick (stringer_t * *s*, chr_t * *format*, ...)**5.78.4.72 stringer_t* st_realloc (stringer_t * *s*, size_t *len*)**

Reallocate a managed string to a specified size.

Note:

The caller can request a new size that is either smaller (truncated) or larger than the original string. Only these types of strings can be reallocated: nuller, block, managed, and mapped. The following logic is applied to string reallocation requests: For jointed strings, a new data buffer is allocated of the requested length, the original contents copied in, the data field of the new string is set, and the original data buffer freed. The stringer header returned to the caller resides at the same address as the original. For contiguous strings, a new data buffer is allocated for both the requested length and the new stringer header, and the data of both parts are copied from the original string to the resulting one. For block strings, the length field of the resulting string is set to the requested length. For managed strings, the length field of the resulting string is set to the original length, but the available field is adjusted accordingly. For mapped strings, an aligned mremap() call is made, and both the length and available fields are set to the new length.

Parameters:

s the managed string to have its size reallocated.

len the new size, in bytes, of the resulting managed string.

Returns:

NULL on failure or a pointer to the newly reallocated managed string on success.

Definition at line 656 of file allocation.c.

5.78.4.74 stringer_t* st_set (stringer_t *s, uint8_t set, size_t len)

Sets a block of memory to a specified value.

Parameters:

s the managed string to be overwritten with the value of set.

set the byte value to be write into the string.

len the number of bytes to set to the provided value.

Returns:

a pointer to the block of memory passed to the function.

Definition at line 246 of file data.c.

References log_pedantic, MEMORYBUF, mm_set(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

5.78.4.76 stringer_t* st_swap (stringer_t *target, uchr_t pattern, uchr_t replacement)

Replace all instances of one character in a managed string with another.

Parameters:

target the input string which will be transformed by the character replacement.

pattern the character to be searched and replaced in the target string.

replacement the character to be substituted for the pattern character in the target string.

Returns:

a pointer to the target managed string.

Definition at line 109 of file replace.c.

References `log_check`, `log_pedantic`, and `st_empty_out()`.

Referenced by `process_kill()`.

5.78.4.77 `uchr_t* st_uchar_get (stringer_t * s)`

Retrieve an unsigned character pointer to a managed string's data buffer.

See also:

[st_data_get\(\)](#)

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 206 of file data.c.

References `st_data_get()`.

Referenced by `dkim_signature_create()`, `http_parse_origin()`, and `prime_pem_unwrap()`.

5.78.4.78 `bool_t st_used_variadic (ssize_t len, ...)`**5.78.4.79 `bool_t st_valid_append (uint32_t opts)`**

Determine whether the managed string options allow for data appending.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, the string is not jointed, or either managed or mapped.

Definition at line 52 of file validate.c.

References `JOINTED`, `MANAGED_T`, `MAPPED_T`, and `st_valid_opts()`.

Referenced by `st_append_opts()`.

5.78.4.80 `bool_t st_valid_avail (uint32_t opts)`

Determine whether a managed string tracks the total allocated buffer size.

Parameters:

opts the managed string's options value.

Returns:

false if buffer size isn't tracked; true otherwise (the managed string is managed or mapped).

Definition at line 123 of file validate.c.

References MANAGED_T, MAPPED_T, and st_valid_opts().

Referenced by base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), deprecated_hmac_digest(), hash_digest(), hex_decode_st(), hex_encode_st(), hmac_digest(), ip_subnet(), rand_write(), st_avail_set(), st_bitwise(), and st_not().

5.78.4.81 bool_t st_valid_destination (uint32_t opts)

Determine whether the managed string options allow for a data store operation.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, or indicate the managed string is constant.

Definition at line 35 of file validate.c.

References CONSTANT_T, and st_valid_opts().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), deprecated_hmac_digest(), ed25519_private_get(), ed25519_public_get(), ed25519_sign(), hash_digest(), hex_decode_st(), hex_encode_st(), hmac_digest(), ip_presentation(), ip_reversed(), ip_standard(), ip_subnet(), meta_data_fetch_shard(), org_key_get(), org_signet_get(), rand_choices(), rand_write(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), st_append_out(), st_bitwise(), st_import_opts(), st_merge_opts(), st_not(), st_output(), st_vaprint_opts(), st_vsprint(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), user_key_get(), user_request_get(), and user_signet_get().

5.78.4.82 bool_t st_valid_free (uint32_t opts)

Determine whether a managed string is allowed to be freed.

Parameters:

opts the options value of the managed string to be evaluated.

Returns:

true if the managed string can be freed; false otherwise (it is allocated on the stack or contains foreign data).

Definition at line 72 of file validate.c.

References FOREIGNDATA, st_valid_opts(), and STACK.

Referenced by st_free(), and st_replace().

5.78.4.83 bool_t st_valid_jointed (uint32_t opts)

Determine whether the managed string options are a validly jointed.

Parameters:

opts the options value to test.

Returns:

false if the options are invalid or if the string isn't jointed; true if the string is jointed.

Definition at line 106 of file validate.c.

References JOINTED, and st_valid_opts().

Referenced by st_data_set().

5.78.4.84 bool_t st_valid_opts (uint32_t *opts*)

Check to see that a managed string has a valid combination of allocation options.

Note:

The following rules are enforced: 1. Each managed string must only be one of the following: a. constant, nuller, block, placer, managed, or mapped. b. jointed or contiguous. c. allocated on the stack, heap, or secure. 2. A placer cannot be contiguous. 3. A constant must be contiguous and be allocated on the stack. 4. Mapped strings must be contiguous and on the heap.

Parameters:

opts the managed string option mask to be validated.

Returns:

true if the options represent valid managed string allocation options, or false if they do not.

Definition at line 149 of file validate.c.

References bitwise_count(), BLOCK_T, CONSTANT_T, CONTIGUOUS, HEAP, JOINTED, MANAGED_T, MAPPED_T, NULLER_T, PLACER_T, SECURE, and STACK.

5.78.4.85 bool_t st_valid_placer (uint32_t *opts*)

A sanity check to determine whether the managed string is a valid placer.

Note:

The following criteria must be satisfied: placer bit set, jointed bit set, either stack, heap, or secure set, and no other bits other than these mentioned should be set.

Parameters:

opts the managed string options value to be evaluated.

Returns:

true if the option value reflects a valid placer, or false otherwise.

Definition at line 17 of file validate.c.

References HEAP, JOINTED, PLACER_T, SECURE, st_valid_opts(), and STACK.

5.78.4.86 bool_t st_valid_tracked (uint32_t *opts*)

Determine whether a managed string provides for data length tracking.

Parameters:

opts the options value of the managed string.

Returns:

false if no length tracking is available; true if there is (string is a placer, managed, or mapped).

Definition at line 89 of file validate.c.

References MANAGED_T, MAPPED_T, PLACER_T, and st_valid_opts().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), chunk_header_write(), deprecated_hmac_digest(), deprecated_symmetric_key(), deprecated_symmetric_vector(), ed25519_private_get(), ed25519_public_get(), ed25519_sign(), hash_digest(), hex_decode_st(), hex_encode_st(), hmac_digest(), ip_presentation(), ip_reversed(), ip_standard(), prime_field_write(), prime_header_write(), rand_choices(), rand_write(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), st_dupe_opts(), st_length_set(), st_merge_opts(), st_set(), st_vaprint_opts(), st_vsprint(), st_wipe(), st_write_variadic(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), symmetric_key(), and symmetric_vector().

5.78.4.87 stringer_t stringer_t stringer_t size_t stringer_t* st_vaprint_opts (uint32_t *opts*, chr_t **format*, va_list *args*)

Return a managed string containing sprintf()-style formatted data.

Parameters:

opts an options value to be passed to the allocation of the resulting managed string.

format a format string for the output string data.

args a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string containing the final formatted data on success.

Definition at line 100 of file print.c.

References length, log_pedantic, MEMORYBUF, st_alloc_opts(), st_data_get(), st_free(), st_info_opts(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by st_aprint(), and st_aprint_opts().

5.78.4.88 size_t st_vsprint (stringer_t **s*, chr_t **format*, va_list *args*)

Print to a managed string and return the number of bytes written.

See also:

vsnprintf()

Note:

If the destination string pointer is NULL the function will simply return how much room would have been necessary.

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

args a va_list containing the parameters to the print format string.

Returns:

-1 on failure, or the number of characters printed to the string, excluding the terminating null byte.

Definition at line 19 of file print.c.

References length, log_pedantic, MEMORYBUF, st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by st_quick(), and st_sprint().

5.78.4.89 void st_wipe (stringer_t * s)

Wipe all of a managed string's allocated memory and if applicable, reset its length.

Parameters:

s the managed string to be wiped.

Returns:

This function returns no value.

Definition at line 216 of file data.c.

References log_pedantic, MEMORYBUF, mm_wipe(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

5.79.1 Function Documentation

5.79.1.1 bool_t st_valid_append (uint32_t opts)

Determine whether the managed string options allow for data appending.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, the string is not jointed, or either managed or mapped.

Definition at line 52 of file validate.c.

References `JOINTED`, `MANAGED_T`, `MAPPED_T`, and `st_valid_opts()`.

Referenced by `st_append_opts()`.

5.79.1.2 `bool_t st_valid_avail (uint32_t opts)`

Determine whether a managed string tracks the total allocated buffer size.

Parameters:

opts the managed string's options value.

Returns:

false if buffer size isn't tracked; true otherwise (the managed string is managed or mapped).

Definition at line 123 of file validate.c.

References `MANAGED_T`, `MAPPED_T`, and `st_valid_opts()`.

Referenced by `base64_decode()`, `base64_decode_mod()`, `base64_encode()`, `base64_encode_mod()`, `base64_encode_wrap()`, `deprecated_hmac_digest()`, `hash_digest()`, `hex_decode_st()`, `hex_encode_st()`, `hmac_digest()`, `ip_subnet()`, `rand_write()`, `st_avail_set()`, `st_bitwise()`, and `st_not()`.

5.79.1.3 `bool_t st_valid_destination (uint32_t opts)`

Determine whether the managed string options allow for a data store operation.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, or indicate the managed string is constant.

Definition at line 35 of file validate.c.

References `CONSTANT_T`, and `st_valid_opts()`.

Referenced by `aes_artifact_decrypt()`, `aes_artifact_encrypt()`, `aes_chunk_decrypt()`, `aes_chunk_encrypt()`, `base64_decode()`, `base64_decode_mod()`, `base64_encode()`, `base64_encode_mod()`, `base64_encode_wrap()`, `deprecated_hmac_digest()`, `ed25519_private_get()`, `ed25519_public_get()`, `ed25519_sign()`, `hash_digest()`, `hex_decode_st()`, `hex_encode_st()`, `hmac_digest()`, `ip_presentation()`, `ip_reversed()`, `ip_standard()`, `ip_subnet()`, `meta_data_fetch_shard()`, `org_key_get()`, `org_signet_get()`, `rand_choices()`, `rand_write()`, `secp256k1_compute_kek()`, `secp256k1_private_get()`, `secp256k1_public_get()`, `st_append_out()`, `st_bitwise()`, `st_import_opts()`, `st_merge_opts()`, `st_not()`, `st_output()`, `st_vaprint_opts()`, `st_vsprint()`, `stacie_create_nonce()`, `stacie_create_salt()`, `stacie_create_shard()`, `user_key_get()`, `user_request_get()`, and `user_signet_get()`.

5.79.1.4 `bool_t st_valid_free (uint32_t opts)`

Determine whether a managed string is allowed to be freed.

Parameters:

opts the options value of the managed string to be evaluated.

Returns:

true if the managed string can be freed; false otherwise (it is allocated on the stack or contains foreign data).

Definition at line 72 of file validate.c.

References `FOREIGNDATA`, `st_valid_opts()`, and `STACK`.

Referenced by `st_free()`, and `st_replace()`.

5.79.1.5 `bool_t st_valid_joined (uint32_t opts)`

Determine whether the managed string options are a validly jointed.

Parameters:

opts the options value to test.

Returns:

false if the options are invalid or if the string isn't jointed; true if the string is jointed.

Definition at line 106 of file validate.c.

References JOINTED, and st_valid_opts().

Referenced by st_data_set().

5.79.1.6 `bool_t st_valid_opts (uint32_t opts)`

Check to see that a managed string has a valid combination of allocation options.

Note:

The following rules are enforced: 1. Each managed string must only be one of the following: a. constant, nuller, block, placer, managed, or mapped. b. jointed or contiguous. c. allocated on the stack, heap, or secure. 2. A placer cannot be contiguous. 3. A constant must be contiguous and be allocated on the stack. 4. Mapped strings must be contiguous and on the heap.

Parameters:

opts the managed string option mask to be validated.

Returns:

true if the options represent valid managed string allocation options, or false if they do not.

Definition at line 149 of file validate.c.

References bitwise_count(), BLOCK_T, CONSTANT_T, CONTIGUOUS, HEAP, JOINTED, MANAGED_T, MAPPED_T, NULLER_T, PLACER_T, SECURE, and STACK.

Referenced by st_alloc_opts(), st_avail_get(), st_data_get(), st_dupe_opts(), st_length_get(), st_length_int(), st_opt_set(), st_opt_test(), st_realloc(), st_set(), st_valid_append(), st_valid_avail(), st_valid_destination(), st_valid_free(), st_valid_joined(), st_valid_placer(), st_valid_tracked(), and st_wipe().

5.79.1.7 `bool_t st_valid_placer (uint32_t opts)`

A sanity check to determine whether the managed string is a valid placer.

Note:

The following criteria must be satisfied: placer bit set, jointed bit set, either stack, heap, or secure set, and no other bits other than these mentioned should be set.

Parameters:

opts the managed string options value to be evaluated.

Returns:

true if the option value reflects a valid placer, or false otherwise.

Definition at line 17 of file validate.c.

References HEAP, JOINTED, PLACER_T, SECURE, st_valid_opts(), and STACK.

5.79.1.8 `bool_t st_valid_tracked(uint32_t opts)`

Determine whether a managed string provides for data length tracking.

Parameters:

opts the options value of the managed string.

Returns:

false if no length tracking is available; true if there is (string is a placer, managed, or mapped).

Definition at line 89 of file validate.c.

References `MANAGED_T`, `MAPPED_T`, `PLACER_T`, and `st_valid_opts()`.

Referenced by `aes_artifact_decrypt()`, `aes_artifact_encrypt()`, `aes_chunk_decrypt()`, `aes_chunk_encrypt()`, `base64_decode()`, `base64_decode_mod()`, `base64_encode()`, `base64_encode_mod()`, `base64_encode_wrap()`, `chunk_header_write()`, `deprecated_hmac_digest()`, `deprecated_symmetric_key()`, `deprecated_symmetric_vector()`, `ed25519_private_get()`, `ed25519_public_get()`, `ed25519_sign()`, `hash_digest()`, `hex_decode_st()`, `hex_encode_st()`, `hmac_digest()`, `ip_presentation()`, `ip_reversed()`, `ip_standard()`, `prime_field_write()`, `prime_header_write()`, `rand_choices()`, `rand_write()`, `secp256k1_compute_kek()`, `secp256k1_private_get()`, `secp256k1_public_get()`, `st_dupe_opts()`, `st_length_set()`, `st_merge_opts()`, `st_set()`, `st_vaprint_opts()`, `st_vsprint()`, `st_wipe()`, `st_write_variadic()`, `stacie_create_nonce()`, `stacie_create_salt()`, `stacie_create_shard()`, `symmetric_key()`, and `symmetric_vector()`.

5.80 src/core/thread/keys.c File Reference

```
#include "magma.h"
```

Functions

- int [tkey_init](#) (pthread_key_t *key, void(*destructor)(void *))
Create a thread-specific data key.
- void * [tkey_get](#) (pthread_key_t key)
Get the calling thread's value for a pthread key.
- int [tkey_set](#) (pthread_key_t key, void *value)
Set the calling thread's value for a pthread key.

5.80.1 Function Documentation

5.80.1.1 void* tkey_get (pthread_key_t key)

Get the calling thread's value for a pthread key. keys.c

See also:

pthread_getspecific()

Parameters:

key the pthread key to be queried.

Returns:

NULL on failure or a pointer to the key's thread-specific data value on success.

Definition at line 35 of file keys.c.

5.80.1.2 int tkey_init (pthread_key_t * key, void(*)(void *) destructor)

Create a thread-specific data key.

See also:

pthread_key_create()

Parameters:

key a pointer to pthread key to be initialized for thread-local storage.

destructor if not NULL, an optional function pointer to be called at thread exit to release the data.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file keys.c.

References log_pedantic.

5.80.1.3 int tkey_set (pthread_key_t *key*, void * *value*)

Set the calling thread's value for a pthread key.

See also:

pthread_setspecific()

Parameters:

key the pthread key to have its thread-local value modified.

value a pointer to the new thread-specific value of the specified key.

Returns:

0 on success, or an error number on failure.

Definition at line 46 of file keys.c.

References log_pedantic.

```

Functions

- int [dime_keys_file_create](#) ([keys_type_t](#) type, [ED25519_KEY](#) *sign_key, [EC_KEY](#) *enc_key, const char *filename)
Creates a keys file with specified signing and encryption keys.
- [ED25519_KEY](#) * [dime_keys_signkey_fetch](#) (char const *filename)
Retrieves the encryption key from the keys file.
- [EC_KEY](#) * [dime_keys_enckey_fetch](#) (char const *filename)
Retrieves the signing key from the keys file.
- int [dime_keys_generate](#) ([keys_type_t](#) type, char **signet_pem, char **key_pem)

5.81.1 Function Documentation

5.81.1.1 [EC_KEY](#) * [dime_keys_enckey_fetch](#) (char const * *filename*)

Retrieves the signing key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the ed25519 signing key. {free_ed25519_key}

Definition at line 633 of file keys.c.

References [PUBLIC_FUNCTION_IMPLEMENT](#).

5.81.1.2 int [dime_keys_file_create](#) ([keys_type_t](#) type, [ED25519_KEY](#) * *sign_key*, [EC_KEY](#) * *enc_key*, const char * *filename*)

Creates a keys file with specified signing and encryption keys.

Parameters:

type Type of keys file, whether the keys correspond to a user or organizational signet.

sign_key Pointer to the specified ed25519 key, the private portion of which will be stored in the keys file as the signing key.

enc_key Pointer to the specified elliptic curve key, the private portion of which will be stored in the keys file as the encryption key.

filename Pointer to the NULL terminated string containing the filename for the keys file.

Returns:

0 on success, -1 on failure.

Definition at line 586 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.81.1.3 int dime_keys_generate (keys_type_t type, char ** *signet_pem*, char ** *key_pem*)

Definition at line 637 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.81.1.4 ED25519_KEY* dime_keys_signkey_fetch (char const * *filename*)

Retrieves the encryption key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the elliptic curve encryption key. {free_ec_key}

Definition at line 620 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.82 src/core/thread/mutex.c File Reference

```
#include "magma.h"
```

Functions

- int [mutex_init](#) (pthread_mutex_t *[lock](#), pthread_mutexattr_t *[attr](#))
Initialize a pthread mutex with the given attributes.
- int [mutex_lock](#) (pthread_mutex_t *[lock](#))
Acquire a pthread mutex, blocking if necessary.
- int [mutex_unlock](#) (pthread_mutex_t *[lock](#))
Unlock a pthread mutex.
- int [mutex_destroy](#) (pthread_mutex_t *[lock](#))
Free a pthread mutex.

5.82.1 Function Documentation

5.82.1.1 int mutex_destroy (pthread_mutex_t * *lock*)

Free a pthread mutex. [mutex.c](#)

See also:

[pthread_mutex_destroy\(\)](#)

Parameters:

lock a pointer to the mutex to be freed.

Returns:

0 on success, or an error number on failure.

Definition at line 77 of file [mutex.c](#).

References [log_pedantic](#), and [MEMORYBUF](#).

Referenced by [con_destroy\(\)](#), [meta_free\(\)](#), [pool_free\(\)](#), [protocol_secure\(\)](#), [queue_shutdown\(\)](#), [sess_destroy\(\)](#), [ssl_stop\(\)](#), [stacker_free\(\)](#), and [stats_shutdown\(\)](#).

5.82.1.2 int mutex_init (pthread_mutex_t * *lock*, pthread_mutexattr_t * *attr*)

Initialize a pthread mutex with the given attributes.

See also:

[pthread_mutex_init\(\)](#)

Parameters:

lock a pointer to a mutex that will be initialized.

attr a pointer to a mutex attributes holder, or NULL to use system default values.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file mutex.c.

References log_pedantic, and MEMORYBUF.

Referenced by con_init(), meta_alloc(), pool_alloc(), queue_init(), ssl_start(), stacker_alloc(), and stats_init().

5.82.1.3 int mutex_lock (pthread_mutex_t * lock)

Acquire a pthread mutex, blocking if necessary.

See also:

pthread_mutex_lock()

Parameters:

lock a pointer to the mutex to be locked.

Returns:

0 on success, or an error number on failure.

Definition at line 37 of file mutex.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, and MEMORYBUF.

Referenced by con_decrement_refs(), con_increment_refs(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), con_reverse_status(), dequeue(), dh_exchange_2048(), dh_exchange_4096(), dh_params_generate(), log_disable(), log_enable(), log_internal(), meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), meta_user_ref_stamp(), meta_user_ref_total(), mm_sec_alloc(), mm_sec_free(), mm_sec_stats(), pattern_check(), pattern_stop(), pattern_update(), pool_get_failures(), pool_get_obj(), pool_pull(), pool_release(), pool_set_obj(), pool_swap_obj(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_messages_compose(), portal_endpoint_messages_send(), portal_get_upload_attachment(), requeue(), sess_number(), sess_ref_add(), sess_ref_dec(), sess_ref_stamp(), sess_ref_total(), sess_refresh_check(), sess_refresh_flush(), sess_refresh_stamp(), sess_trigger(), signal_refresh(), spool_check(), spool_check_file(), spool_error_stats(), spool_mktemp(), spool_start(), ssl_locking_callback(), stacker_nodes(), stacker_pop(), stacker_push(), statistics_refresh(), stats_adjust_by_name(), stats_adjust_by_num(), stats_decrement_by_name(), stats_decrement_by_num(), stats_get_name(), stats_get_name_pos(), stats_get_value_by_name(), stats_get_value_by_num(), stats_increment_by_name(), stats_increment_by_num(), stats_set_by_name(), stats_set_by_num(), and tank_cycle().

5.82.1.4 int mutex_unlock (pthread_mutex_t * lock)

Unlock a pthread mutex.

See also:

pthread_mutex_unlock()

Parameters:

lock a pointer to the mutex to be unlocked.

Returns:

0 on success, or an error number on failure.

Definition at line 57 of file mutex.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, and MEMORYBUF.

Referenced by `con_decrement_refs()`, `con_increment_refs()`, `con_reverse_check()`, `con_reverse_domain()`, `con_reverse_enqueue()`, `con_reverse_status()`, `dequeue()`, `dh_exchange_2048()`, `dh_exchange_4096()`, `dh_params_generate()`, `log_disable()`, `log_enable()`, `log_internal()`, `meta_user_ref_add()`, `meta_user_ref_dec()`, `meta_user_ref_protocol_total()`, `meta_user_ref_stamp()`, `meta_user_ref_total()`, `mm_sec_alloc()`, `mm_sec_free()`, `mm_sec_stats()`, `pattern_check()`, `pattern_stop()`, `pattern_update()`, `pool_get_failures()`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `pool_set_obj()`, `pool_swap_obj()`, `portal_endpoint_attachments_add()`, `portal_endpoint_attachments_remove()`, `portal_endpoint_messages_compose()`, `portal_endpoint_messages_send()`, `portal_get_upload_attachment()`, `requeue()`, `sess_number()`, `sess_ref_add()`, `sess_ref_dec()`, `sess_ref_stamp()`, `sess_ref_total()`, `sess_refresh_check()`, `sess_refresh_flush()`, `sess_refresh_stamp()`, `sess_trigger()`, `signal_refresh()`, `spool_check()`, `spool_check_file()`, `spool_error_stats()`, `spool_mktemp()`, `spool_start()`, `ssl_locking_callback()`, `stacker_nodes()`, `stacker_pop()`, `stacker_push()`, `statistics_refresh()`, `stats_adjust_by_name()`, `stats_adjust_by_num()`, `stats_decrement_by_name()`, `stats_decrement_by_num()`, `stats_get_name()`, `stats_get_name_pos()`, `stats_get_value_by_name()`, `stats_get_value_by_num()`, `stats_increment_by_name()`, `stats_increment_by_num()`, `stats_set_by_name()`, `stats_set_by_num()`, and `tank_cycle()`.

5.83 src/core/thread/rwlock.c File Reference

```
#include "magma.h"
```

Functions

- int [rwlock_init](#) (pthread_rwlock_t *[lock](#), pthread_rwlockattr_t *attr)
Initialize a pthread read/write lock.
- int [rwlock_lock_write](#) (pthread_rwlock_t *[lock](#))
Attempt to acquire a pthread read/write lock for writing, blocking if necessary.
- int [rwlock_lock_read](#) (pthread_rwlock_t *[lock](#))
Attempt to acquire a pthread read/write lock for reading, blocking if necessary.
- int [rwlock_unlock](#) (pthread_rwlock_t *[lock](#))
Unlock a pthread read/write lock.
- int [rwlock_destroy](#) (pthread_rwlock_t *[lock](#))
Free a pthread read/write lock and free its resources.
- int [rwlock_attr_init](#) (pthread_rwlockattr_t *attr)
Initialize a pthread read/write lock attributes object with default values.
- int [rwlock_attr_destroy](#) (pthread_rwlockattr_t *attr)
Free a pthread read/write lock attributes object.
- int [rwlock_attr_setkind](#) (pthread_rwlockattr_t *attr, int pref)
Set the kind of a pthread read/write lock attributes object.
- int [rwlock_attr_getkind](#) (pthread_rwlockattr_t *attr, int *pref)
Get the kind of a pthread read/write lock attributes object.

5.83.1 Function Documentation

5.83.1.1 int [rwlock_attr_destroy](#) (pthread_rwlockattr_t * *attr*)

Free a pthread read/write lock attributes object. [rwlock.c](#)

See also:

`pthread_rwlockattr_destroy()`

Parameters:

attr a pointer to the read/write lock attributes object to be freed.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `meta_alloc()`.

5.83.1.2 `int rwlock_attr_getkind(pthread_rwlockattr_t * attr, int * pref)`

Get the kind of a pthread read/write lock attributes object.

See also:

`pthread_rwlockattr_getkind_np()`

Parameters:

attr a pointer to the read/write lock attributes object to be queried.

pref a pointer to an integer that will receive the kind of the read/write lock.

Returns:

0 on success or an error number on failure.

Definition at line 155 of file `rwlock.c`.

References `log_pedantic`.

5.83.1.3 `int rwlock_attr_init(pthread_rwlockattr_t * attr)`

Initialize a pthread read/write lock attributes object with default values.

See also:

`pthread_rwlockattr_init()`

Parameters:

attr a pointer to the read/write lock attributes object to be initialized.

Returns:

0 on success or an error number on failure.

Definition at line 105 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `meta_alloc()`.

5.83.1.4 `int rwlock_attr_setkind(pthread_rwlockattr_t * attr, int pref)`

Set the kind of a pthread read/write lock attributes object.

See also:

`pthread_rwlockattr_setkind_np()`

Parameters:

attr a pointer to the read/write lock attributes object to be adjusted.

pref the kind of the read/write lock: `PTHREAD_RWLOCK_PREFER_READER_NP`, `PTHREAD_RWLOCK_PREFER_WRITER_NP`, or `PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP`.

Returns:

0 on success or an error number on failure.

Definition at line 138 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.83.1.5 int **rwlock_destroy** (pthread_rwlock_t * *lock*)

Free a pthread read/write lock and free its resources.

See also:

pthread_rwlock_destroy()

Parameters:

lock a pointer to the read/write lock to be destroyed.

Returns:

0 on success or an error number on failure.

Definition at line 89 of file rwlock.c.

References log_pedantic.

Referenced by inx_free(), magma_folder_free(), message_free(), meta_alloc(), and meta_free().

5.83.1.6 int **rwlock_init** (pthread_rwlock_t * *lock*, pthread_rwlockattr_t * *attr*)

Initialize a pthread read/write lock.

See also:

pthread_rwlock_init()

Parameters:

lock a pointer to the read/write lock to be initialized.

attr an optional pointer to a set of lock attributes, or the default attributes if NULL is specified.

Returns:

0 on success or an error number on failure.

Definition at line 17 of file rwlock.c.

References log_pedantic.

Referenced by inx_alloc(), magma_folder_alloc(), message_alloc(), and meta_alloc().

5.83.1.7 int **rwlock_lock_read** (pthread_rwlock_t * *lock*)

Attempt to acquire a pthread read/write lock for reading, blocking if necessary.

See also:

pthread_rwlock_rdlock()

Parameters:

lock the read-write lock to be tried.

Returns:

0 on success or an error number on failure.

Definition at line 53 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_read(), inx_lock_read(), meta_user_rlock(), register_abuse_check_blocklist(), spool_mktemp(), status(), and status_get().

5.83.1.8 int rwlock_lock_write (pthread_rwlock_t * lock)

Attempt to acquire a pthread read/write lock for writing, blocking if necessary.

See also:

pthread_rwlock_wrlock()

Parameters:

lock a pointer to the read/write lock to be acquired.

Returns:

0 on success or an error number on failure.

Definition at line 35 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_write(), inx_lock_write(), meta_user_wlock(), register_blocklist_update(), spool_cleanup(), status_set(), and status_signal().

5.83.1.9 int rwlock_unlock (pthread_rwlock_t * lock)

Unlock a pthread read/write lock.

See also:

pthread_rwlock_unlock()

Parameters:

lock a pointer to the read/write lock to be unlocked.

Returns:

0 on success or an error number on failure.

Definition at line 71 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_unlock(), inx_unlock(), meta_user_unlock(), register_abuse_check_blocklist(), register_blocklist_update(), spool_cleanup(), spool_mktemp(), status(), status_get(), status_set(), and status_signal().

5.84 src/core/thread/thread.c File Reference

```
#include "magma.h"
```

Functions

- pthread_t [thread_get_thread_id](#) (void)
Get the id of the calling thread.
- int_t [thread_launch](#) (pthread_t *thread, void *function, void *data)
Launch a thread to execute a specified function.
- pthread_t * [thread_alloc](#) (void *function, void *data)
Launch a function in a freshly created thread.
- int_t [thread_join](#) (pthread_t thread)
Block until a specified thread finishes execution.
- int_t [thread_result](#) (pthread_t thread, void **result)
Block until a specified thread finishes execution and store its exit value.
- int_t [thread_signal](#) (pthread_t thread, int_t signal)
Send a specified signal to a thread.
- int_t [thread_cancel](#) (pthread_t thread)
Send a cancellation request to a thread.
- void [thread_cancel_enable](#) (void)
Set the calling thread to be cancelable.
- void [thread_cancel_disable](#) (void)
Set the calling thread to be not cancelable.

5.84.1 Function Documentation

5.84.1.1 pthread_t* [thread_alloc](#) (void *function, void *data)

Launch a function in a freshly created thread. thread.c

See also:

[pthread_create_new\(\)](#)

Parameters:

function a pointer to the function to be executed.
data a pointer to data to be passed to the executed function.

Returns:

NULL on failure, or a pointer to the newly created pthread on success.

Definition at line 62 of file thread.c.

References [log_pedantic](#), [mm_alloc\(\)](#), [mm_free\(\)](#), and [thread_launch\(\)](#).

Referenced by [net_listen\(\)](#).

5.84.1.2 `int_t thread_cancel (pthread_t thread)`

Send a cancellation request to a thread.

Parameters:

thread the pthread id of the thread to be canceled.

Returns:

0 on success or a non-zero error number on failure.

Definition at line 131 of file thread.c.

References `log_pedantic`.

5.84.1.3 `void thread_cancel_disable (void)`

Set the calling thread to be not cancelable.

Returns:

This function returns no value.

Definition at line 162 of file thread.c.

Referenced by `process_maint()`.

5.84.1.4 `void thread_cancel_enable (void)`

Set the calling thread to be cancelable.

Returns:

This function returns no value.

Definition at line 153 of file thread.c.

Referenced by `process_maint()`.

5.84.1.5 `pthread_t thread_get_thread_id (void)`

Get the id of the calling thread.

Returns:

the id of the calling thread.

Definition at line 14 of file thread.c.

Referenced by `rand_start()`, `rand_thread_start()`, `spool_mktemp()`, and `ssl_thread_id_callback()`.

5.84.1.6 `int_t thread_join (pthread_t thread)`

Block until a specified thread finishes execution.

Note:

`pthread_join()`

Parameters:

thread the thread to wait upon.

Returns:

0 on success, or an error number on failure.

Definition at line 86 of file thread.c.

References log_pedantic.

Referenced by net_listen(), process_stop(), queue_shutdown(), and signal_shutdown().

5.84.1.7 int_t thread_launch (pthread_t * *thread*, void * *function*, void * *data*)

Launch a thread to execute a specified function.

See also:

pthread_create()

Parameters:

thread a pointer to a pthread object to receive the new thread id.

function a pointer to a function to be executed inside the new thread.

data a pointer to be data to be passed in as input to the called function.

Returns:

0 on success, or a non-zero error code on failure.

Definition at line 27 of file thread.c.

References log_pedantic, magma, magma_t::system, and magma_t::thread_stack_size.

Referenced by process_start(), queue_init(), signal_shutdown(), and thread_alloc().

5.84.1.8 int_t thread_result (pthread_t *thread*, void ** *result*)

Block until a specified thread finishes execution and store its exit value.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

result a pointer to a block of memory to receive the target thread exit value.

Returns:

0 on success, or an error number on failure.

Definition at line 104 of file thread.c.

References log_pedantic.

5.84.1.9 `int_t thread_signal(pthread_t thread, int_t signal)`

Send a specified signal to a thread.

Parameters:

thread the target thread id.

signal the number of the signal to be delivered.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file thread.c.

Referenced by `process_stop()`, and `queue_signal()`.

5.85 src/engine/context/thread.c File Reference

```
#include "magma.h"
```

Functions

- void [thread_stop](#) (void)
Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.
- [bool_t thread_start](#) (void)
Setup a new thread by registering the signal handlers and preparing the MySQL thread specific storage.

5.85.1 Function Documentation

5.85.1.1 [bool_t thread_start](#) (void)

Setup a new thread by registering the signal handlers and preparing the MySQL thread specific storage. [thread.c](#)

Returns:

true on success or false on failure.

Definition at line 27 of file [thread.c](#).

References [signal_thread_start\(\)](#), and [sql_thread_start\(\)](#).

Referenced by [dequeue\(\)](#), [net_accept\(\)](#), and [process_maint\(\)](#).

5.85.1.2 [void thread_stop](#) (void)

Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

Returns:

This function returns no value.

Definition at line 14 of file [thread.c](#).

References [mail_cache_thread_stop\(\)](#), [sql_thread_stop\(\)](#), and [ssl_thread_stop\(\)](#).

Referenced by [dequeue\(\)](#), [net_accept\(\)](#), and [process_maint\(\)](#).

5.86 src/core/thread/thread.h File Reference

Functions

- pthread_t * [thread_alloc](#) (void *function, void *data)
thread.c
- int_t [thread_cancel](#) (pthread_t thread)
Send a cancellation request to a thread.
- void [thread_cancel_disable](#) (void)
Set the calling thread to be not cancelable.
- void [thread_cancel_enable](#) (void)
Set the calling thread to be cancelable.
- pthread_t [thread_get_thread_id](#) (void)
Get the id of the calling thread.
- int_t [thread_join](#) (pthread_t thread)
Block until a specified thread finishes execution.
- int_t [thread_launch](#) (pthread_t *thread, void *function, void *data)
Launch a thread to execute a specified function.
- int_t [thread_result](#) (pthread_t thread, void **result)
Block until a specified thread finishes execution and store its exit value.
- int_t [thread_signal](#) (pthread_t thread, int_t signal)
Send a specified signal to a thread.
- int [rwlock_attr_destroy](#) (pthread_rwlockattr_t *attr)
rwlock.c
- int [rwlock_attr_getkind](#) (pthread_rwlockattr_t *attr, int *pref)
Get the kind of a pthread read/write lock attributes object.
- int [rwlock_attr_init](#) (pthread_rwlockattr_t *attr)
Initialize a pthread read/write lock attributes object with default values.
- int [rwlock_attr_setkind](#) (pthread_rwlockattr_t *attr, int pref)
Set the kind of a pthread read/write lock attributes object.
- int [rwlock_destroy](#) (pthread_rwlock_t *lock)
Free a pthread read/write lock and free its resources.
- int [rwlock_init](#) (pthread_rwlock_t *lock, pthread_rwlockattr_t *attr)
Initialize a pthread read/write lock.
- int [rwlock_lock_read](#) (pthread_rwlock_t *lock)
Attempt to acquire a pthread read/write lock for reading, blocking if necessary.
- int [rwlock_lock_write](#) (pthread_rwlock_t *lock)

Attempt to acquire a pthread read/write lock for writing, blocking if necessary.

- int [rwlock_unlock](#) (pthread_rwlock_t *[lock](#))

Unlock a pthread read/write lock.

- void * [tkey_get](#) (pthread_key_t key)

keys.c

- int [tkey_init](#) (pthread_key_t *key, void(*destructor)(void *))

Create a thread-specific data key.

- int [tkey_set](#) (pthread_key_t key, void *value)

Set the calling thread's value for a pthread key.

- int [mutex_destroy](#) (pthread_mutex_t *[lock](#))

mutex.c

- int [mutex_init](#) (pthread_mutex_t *[lock](#), pthread_mutexattr_t *attr)

Initialize a pthread mutex with the given attributes.

- int [mutex_lock](#) (pthread_mutex_t *[lock](#))

Acquire a pthread mutex, blocking if necessary.

- int [mutex_unlock](#) (pthread_mutex_t *[lock](#))

Unlock a pthread mutex.

5.86.1 Function Documentation

5.86.1.1 int [mutex_destroy](#) (pthread_mutex_t * *lock*)

[mutex.c](#) [mutex.c](#)

See also:

[pthread_mutex_destroy\(\)](#)

Parameters:

lock a pointer to the mutex to be freed.

Returns:

0 on success, or an error number on failure.

Definition at line 77 of file [mutex.c](#).

References [log_pedantic](#), and [MEMORYBUF](#).

Referenced by [con_destroy\(\)](#), [meta_free\(\)](#), [pool_free\(\)](#), [protocol_secure\(\)](#), [queue_shutdown\(\)](#), [sess_destroy\(\)](#), [ssl_stop\(\)](#), [stacker_free\(\)](#), and [stats_shutdown\(\)](#).

5.86.1.2 int mutex_init (pthread_mutex_t * *lock*, pthread_mutexattr_t * *attr*)

Initialize a pthread mutex with the given attributes.

See also:

pthread_mutex_init()

Parameters:

lock a pointer to a mutex that will be initialized.

attr a pointer to a mutex attributes holder, or NULL to use system default values.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file mutex.c.

References log_pedantic, and MEMORYBUF.

Referenced by con_init(), meta_alloc(), pool_alloc(), queue_init(), ssl_start(), stacker_alloc(), and stats_init().

5.86.1.3 int mutex_lock (pthread_mutex_t * *lock*)

Acquire a pthread mutex, blocking if necessary.

See also:

pthread_mutex_lock()

Parameters:

lock a pointer to the mutex to be locked.

Returns:

0 on success, or an error number on failure.

Definition at line 37 of file mutex.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, and MEMORYBUF.

Referenced by con_decrement_refs(), con_increment_refs(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), con_reverse_status(), dequeue(), dh_exchange_2048(), dh_exchange_4096(), dh_params_generate(), log_disable(), log_enable(), log_internal(), meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), meta_user_ref_stamp(), meta_user_ref_total(), mm_sec_alloc(), mm_sec_free(), mm_sec_stats(), pattern_check(), pattern_stop(), pattern_update(), pool_get_failures(), pool_get_obj(), pool_pull(), pool_release(), pool_set_obj(), pool_swap_obj(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_messages_compose(), portal_endpoint_messages_send(), portal_get_upload_attachment(), requeue(), sess_number(), sess_ref_add(), sess_ref_dec(), sess_ref_stamp(), sess_ref_total(), sess_refresh_check(), sess_refresh_flush(), sess_refresh_stamp(), sess_trigger(), signal_refresh(), spool_check(), spool_check_file(), spool_error_stats(), spool_mktemp(), spool_start(), ssl_locking_callback(), stacker_nodes(), stacker_pop(), stacker_push(), statistics_refresh(), stats_adjust_by_name(), stats_adjust_by_num(), stats_decrement_by_name(), stats_decrement_by_num(), stats_get_name(), stats_get_name_pos(), stats_get_value_by_name(), stats_get_value_by_num(), stats_increment_by_name(), stats_increment_by_num(), stats_set_by_name(), stats_set_by_num(), and tank_cycle().

5.86.1.4 int mutex_unlock (pthread_mutex_t * *lock*)

Unlock a pthread mutex.

See also:

`pthread_mutex_unlock()`

Parameters:

lock a pointer to the mutex to be unlocked.

Returns:

0 on success, or an error number on failure.

Definition at line 57 of file `mutex.c`.

References `log_options`, `M_LOG_PEDANTIC`, `M_LOG_STACK_TRACE`, and `MEMORYBUF`.

Referenced by `con_decrement_refs()`, `con_increment_refs()`, `con_reverse_check()`, `con_reverse_domain()`, `con_reverse_enqueue()`, `con_reverse_status()`, `dequeue()`, `dh_exchange_2048()`, `dh_exchange_4096()`, `dh_params_generate()`, `log_disable()`, `log_enable()`, `log_internal()`, `meta_user_ref_add()`, `meta_user_ref_dec()`, `meta_user_ref_protocol_total()`, `meta_user_ref_stamp()`, `meta_user_ref_total()`, `mm_sec_alloc()`, `mm_sec_free()`, `mm_sec_stats()`, `pattern_check()`, `pattern_stop()`, `pattern_update()`, `pool_get_failures()`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `pool_set_obj()`, `pool_swap_obj()`, `portal_endpoint_attachments_add()`, `portal_endpoint_attachments_remove()`, `portal_endpoint_messages_compose()`, `portal_endpoint_messages_send()`, `portal_get_upload_attachment()`, `requeue()`, `sess_number()`, `sess_ref_add()`, `sess_ref_dec()`, `sess_ref_stamp()`, `sess_ref_total()`, `sess_refresh_check()`, `sess_refresh_flush()`, `sess_refresh_stamp()`, `sess_trigger()`, `signal_refresh()`, `spool_check()`, `spool_check_file()`, `spool_error_stats()`, `spool_mkdir()`, `spool_start()`, `ssl_locking_callback()`, `stacker_nodes()`, `stacker_pop()`, `stacker_push()`, `statistics_refresh()`, `stats_adjust_by_name()`, `stats_adjust_by_num()`, `stats_decrement_by_name()`, `stats_decrement_by_num()`, `stats_get_name()`, `stats_get_name_pos()`, `stats_get_value_by_name()`, `stats_get_value_by_num()`, `stats_increment_by_name()`, `stats_increment_by_num()`, `stats_set_by_name()`, `stats_set_by_num()`, and `tank_cycle()`.

5.86.1.5 int rwlock_attr_destroy (pthread_rwlockattr_t * attr)

[rwlock.c](#) [rwlock.c](#)

See also:

`pthread_rwlockattr_destroy()`

Parameters:

attr a pointer to the read/write lock attributes object to be freed.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `meta_alloc()`.

5.86.1.6 int rwlock_attr_getkind (pthread_rwlockattr_t * attr, int * pref)

Get the kind of a pthread read/write lock attributes object.

See also:

`pthread_rwlockattr_getkind_np()`

Parameters:

attr a pointer to the read/write lock attributes object to be queried.

pref a pointer to an integer that will receive the kind of the read/write lock.

Returns:

0 on success or an error number on failure.

Definition at line 155 of file rwlock.c.

References log_pedantic.

5.86.1.7 int rwlock_attr_init (pthread_rwlockattr_t * attr)

Initialize a pthread read/write lock attributes object with default values.

See also:

pthread_rwlockattr_init()

Parameters:

attr a pointer to the read/write lock attributes object to be initialized.

Returns:

0 on success or an error number on failure.

Definition at line 105 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.86.1.8 int rwlock_attr_setkind (pthread_rwlockattr_t * attr, int pref)

Set the kind of a pthread read/write lock attributes object.

See also:

pthread_rwlockattr_setkind_np()

Parameters:

attr a pointer to the read/write lock attributes object to be adjusted.

pref the kind of the read/write lock: PTHREAD_RWLOCK_PREFER_READER_NP, PTHREAD_RWLOCK_PREFER_WRITER_NP, or PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP.

Returns:

0 on success or an error number on failure.

Definition at line 138 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.86.1.9 int rwlock_destroy (pthread_rwlock_t * lock)

Free a pthread read/write lock and free its resources.

See also:

`pthread_rwlock_destroy()`

Parameters:

lock a pointer to the read/write lock to be destroyed.

Returns:

0 on success or an error number on failure.

Definition at line 89 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `inx_free()`, `magma_folder_free()`, `message_free()`, `meta_alloc()`, and `meta_free()`.

5.86.1.10 `int pthread_rwlock_init(pthread_rwlock_t *lock, pthread_rwlockattr_t *attr)`

Initialize a pthread read/write lock.

See also:

`pthread_rwlock_init()`

Parameters:

lock a pointer to the read/write lock to be initialized.

attr an optional pointer to a set of lock attributes, or the default attributes if NULL is specified.

Returns:

0 on success or an error number on failure.

Definition at line 17 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `inx_alloc()`, `magma_folder_alloc()`, `message_alloc()`, and `meta_alloc()`.

5.86.1.11 `int pthread_rwlock_read(pthread_rwlock_t *lock)`

Attempt to acquire a pthread read/write lock for reading, blocking if necessary.

See also:

`pthread_rwlock_rdlock()`

Parameters:

lock the read-write lock to be tried.

Returns:

0 on success or an error number on failure.

Definition at line 53 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `inx_auto_read()`, `inx_lock_read()`, `meta_user_rlock()`, `register_abuse_check_blocklist()`, `spool_mktemp()`, `status()`, and `status_get()`.

5.86.1.12 `int rwlock_lock_write(pthread_rwlock_t * lock)`

Attempt to acquire a pthread read/write lock for writing, blocking if necessary.

See also:

`pthread_rwlock_wrlock()`

Parameters:

lock a pointer to the read/write lock to be acquired.

Returns:

0 on success or an error number on failure.

Definition at line 35 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `inx_auto_write()`, `inx_lock_write()`, `meta_user_wlock()`, `register_blocklist_update()`, `spool_cleanup()`, `status_set()`, and `status_signal()`.

5.86.1.13 `int rwlock_unlock(pthread_rwlock_t * lock)`

Unlock a pthread read/write lock.

See also:

`pthread_rwlock_unlock()`

Parameters:

lock a pointer to the read/write lock to be unlocked.

Returns:

0 on success or an error number on failure.

Definition at line 71 of file `rwlock.c`.

References `log_pedantic`.

Referenced by `inx_auto_unlock()`, `inx_unlock()`, `meta_user_unlock()`, `register_abuse_check_blocklist()`, `register_blocklist_update()`, `spool_cleanup()`, `spool_mktemp()`, `status()`, `status_get()`, `status_set()`, and `status_signal()`.

5.86.1.14 `pthread_t* thread_alloc(void * function, void * data)`

`thread.c` `thread.c`

See also:

`pthread_create_new()`

Parameters:

function a pointer to the function to be executed.

data a pointer to data to be passed to the executed function.

Returns:

NULL on failure, or a pointer to the newly created pthread on success.

Definition at line 62 of file thread.c.

References log_pedantic, mm_alloc(), mm_free(), and thread_launch().

Referenced by net_listen().

5.86.1.15 int_t thread_cancel (pthread_t *thread*)

Send a cancellation request to a thread.

Parameters:

thread the pthread id of the thread to be canceled.

Returns:

0 on success or a non-zero error number on failure.

Definition at line 131 of file thread.c.

References log_pedantic.

5.86.1.16 void thread_cancel_disable (void)

Set the calling thread to be not cancelable.

Returns:

This function returns no value.

Definition at line 162 of file thread.c.

Referenced by process_maint().

5.86.1.17 void thread_cancel_enable (void)

Set the calling thread to be cancelable.

Returns:

This function returns no value.

Definition at line 153 of file thread.c.

Referenced by process_maint().

5.86.1.18 pthread_t thread_get_thread_id (void)

Get the id of the calling thread.

Returns:

the id of the calling thread.

Definition at line 14 of file thread.c.

Referenced by rand_start(), rand_thread_start(), spool_mktemp(), and ssl_thread_id_callback().

5.86.1.19 int_t thread_join (pthread_t *thread*)

Block until a specified thread finishes execution.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

Returns:

0 on success, or an error number on failure.

Definition at line 86 of file thread.c.

References log_pedantic.

Referenced by net_listen(), process_stop(), queue_shutdown(), and signal_shutdown().

5.86.1.20 int_t thread_launch (pthread_t * *thread*, void * *function*, void * *data*)

Launch a thread to execute a specified function.

See also:

pthread_create()

Parameters:

thread a pointer to a pthread object to receive the new thread id.

function a pointer to a function to be executed inside the new thread.

data a pointer to be data to be passed in as input to the called function.

Returns:

0 on success, or a non-zero error code on failure.

Definition at line 27 of file thread.c.

References log_pedantic, magma, magma_t::system, and magma_t::thread_stack_size.

Referenced by process_start(), queue_init(), signal_shutdown(), and thread_alloc().

5.86.1.21 int_t thread_result (pthread_t *thread*, void ** *result*)

Block until a specified thread finishes execution and store its exit value.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

result a pointer to a block of memory to receive the target thread exit value.

Returns:

0 on success, or an error number on failure.

Definition at line 104 of file thread.c.

References log_pedantic.

5.86.1.22 int_t thread_signal (pthread_t *thread*, int_t *signal*)

Send a specified signal to a thread.

Parameters:

thread the target thread id.

signal the number of the signal to be delivered.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file thread.c.

Referenced by process_stop(), and queue_signal().

5.86.1.23 void* tkey_get (pthread_key_t *key*)

keys.c keys.c

See also:

pthread_getspecific()

Parameters:

key the pthread key to be queried.

Returns:

NULL on failure or a pointer to the key's thread-specific data value on success.

Definition at line 35 of file keys.c.

5.86.1.24 int tkey_init (pthread_key_t * *key*, void(*)(void *) *destructor*)

Create a thread-specific data key.

See also:

pthread_key_create()

Parameters:

key a pointer to pthread key to be initialized for thread-local storage.

destructor if not NULL, an optional function pointer to be called at thread exit to release the data.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file keys.c.

References log_pedantic.

5.86.1.25 `int tkey_set(pthread_key_t key, void * value)`

Set the calling thread's value for a pthread key.

See also:

`pthread_setspecific()`

Parameters:

key the pthread key to have its thread-local value modified.

value a pointer to the new thread-specific value of the specified key.

Returns:

0 on success, or an error number on failure.

Definition at line 46 of file keys.c.

References `log_pedantic`.

5.87 src/core/type.c File Reference

```
#include "magma.h"
```

Functions

- char * [type](#) ([M_TYPE](#) type)

5.87.1 Function Documentation

5.87.1.1 char* type (M_TYPE type)

Takes a type code and returns the fully enumerated string associated with that type.

Parameters:

type The type code to evaluate.

Returns:

Null terminated string containing type name. String is stored in static buffer and returned as a pointer.

Definition at line 17 of file type.c.

References [M_TYPE_BLOCK](#), [M_TYPE_BOOLEAN](#), [M_TYPE_DOUBLE](#), [M_TYPE_ENUM](#), [M_TYPE_FLOAT](#), [M_TYPE_INT16](#), [M_TYPE_INT32](#), [M_TYPE_INT64](#), [M_TYPE_INT8](#), [M_TYPE_MULTI](#), [M_TYPE_NULLER](#), [M_TYPE_PLACER](#), [M_TYPE_STRINGER](#), [M_TYPE_UINT16](#), [M_TYPE_UINT32](#), [M_TYPE_UINT64](#), and [M_TYPE_UINT8](#).

#include "keys.h"
```

Functions

- void `cache_free` (void)
Free magma's cache server configuration options.
- `cache_t * cache_alloc` (uint32_t *number*)
Allocate a new cache server configuration entry and initialize it to its default values.
- `bool_t cache_validate` (void)
Validate all of the configured magma cache server instances.
- void `cache_output_settings` (void)
Log the full contents of the magma cache configuration settings.
- `bool_t cache_set_value` (`cache_keys_t` **setting*, `cache_t` **cache*, `stringer_t` **value*)
Set the value of a key for a specified cache server configuration entry.
- `bool_t cache_config` (`stringer_t` **name*, `stringer_t` **value*)
Set the value of a cache server configuration entry by name.
- void `cache_output_help` (void)
Log all cache key information to be returned via "magma -h".

5.88.1 Function Documentation

5.88.1.1 `cache_t* cache_alloc (uint32_t number)`

Allocate a new cache server configuration entry and initialize it to its default values.

Parameters:

number the index of the cache server instance in the global cache server array.

Returns:

NULL on failure, or a pointer to the requested cache server configuration entry on success.

Definition at line 64 of file cache.c.

References `magma_t::cache`, `cache_keys`, `cache_set_value()`, `magma_t::iface`, `log_critical`, `magma`, and `mm_alloc()`.

Referenced by `cache_config()`.

5.88.1.2 `bool_t cache_config (stringer_t * name, stringer_t * value)`

Set the value of a cache server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new cache server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable cache server configuration parameter to be set.

value a managed string containing the new value of the cache server config key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 425 of file cache.c.

References bracket_extract_pl(), cache_alloc(), cache_keys, cache_set_value(), CONSTANT, log_critical, MAGMA_CACHE_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.88.1.3 void cache_free (void)

Free magma's cache server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 17 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, mm_free(), cache_keys_t::norm, ns_empty(), ns_free(), cache_keys_t::offset, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.88.1.4 void cache_output_help (void)

Log all cache key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 484 of file cache.c.

References multi_t::bl, cache_keys, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, cache_keys_t::norm, cache_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.88.1.5 void cache_output_settings (void)

Log the full contents of the magma cache configuration settings.

Note:

This logs all the details of each memcached instance configured to work with magma.

Returns:

This function returns no value.

Definition at line 207 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.88.1.6 bool_t cache_set_value (cache_keys_t * setting, cache_t * cache, stringer_t * value)

Set the value of a key for a specified cache server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the cache server key to be set.

cache a pointer to the cache server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 282 of file cache.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, cache_keys_t::name, cache_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), cache_keys_t::offset, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by cache_alloc(), and cache_config().

5.88.1.7 bool_t cache_validate (void)

Validate all of the configured magma cache server instances.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all cache servers have been validated, or false on failure.

Definition at line 93 of file cache.c.

References magma_t::cache, cache_keys, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, magma_t::iface, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_empty, multi_t::type, type(), multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Functions

- void [mail_cache_destroy](#) (void *holder)
Free a cached mail message.
- [bool_t mail_cache_start](#) (void)
Initialize the thread-specific data key used for the mail message cache.
- void [mail_cache_stop](#) (void)
Destroy the thread-specific data key used for the mail message cache.
- void [mail_cache_thread_stop](#) (void)
Free the thread-specific data for the mail message cache.
- [stringer_t * mail_cache_get](#) (uint64_t messagenum)
Attempt to retrieve the contents of a message from the thread's cached data.
- void [mail_cache_reset](#) (void)
Reset the thread's mail cache and free any held message.
- void [mail_cache_set](#) (uint64_t messagenum, [stringer_t](#) *text)
Set the contents of the thread's mail cache.

5.89.1 Function Documentation

5.89.1.1 void mail_cache_destroy (void * holder)

Free a cached mail message. cache.c

Parameters:

holder a pointer to the cached mail message object to be freed.

Returns:

This function returns no value.

Definition at line 17 of file cache.c.

References [mm_free\(\)](#), [st_cleanup](#), and [mail_cache_t::text](#).

Referenced by [mail_cache_start\(\)](#), and [mail_cache_thread_stop\(\)](#).

5.89.1.2 stringer_t* mail_cache_get (uint64_t messagenum)

Attempt to retrieve the contents of a message from the thread's cached data.

Note:

The thread's cache only has the capacity to store a single message.

Parameters:

messagenum the id of the message to be retrieved.

Returns:

NULL on failure or a managed string containing the message data on success.

Definition at line 78 of file cache.c.

References mail_cache_t::messagenum, st_dup(), and mail_cache_t::text.

Referenced by mail_load_message().

5.89.1.3 void mail_cache_reset (void)

Reset the thread's mail cache and free any held message.

Returns:

This function returns no value.

Definition at line 97 of file cache.c.

References mail_cache_t::messagenum, mm_free(), st_cleanup, and mail_cache_t::text.

Referenced by imap_session_destroy(), and pop_session_destroy().

5.89.1.4 void mail_cache_set (uint64_t messagenum, stringer_t * text)

Set the contents of the thread's mail cache.

Parameters:

messagenum the numerical id of the message to be cached. a managed string containing the contents of the specified message to be cached.

Returns:

This function returns no value.

Definition at line 118 of file cache.c.

References CONTIGUOUS, HEAP, log_pedantic, MANAGED_T, mail_cache_t::messagenum, mm_alloc(), mm_free(), st_cleanup, st_dup_opts(), and mail_cache_t::text.

Referenced by mail_load_message().

5.89.1.5 bool_t mail_cache_start (void)

Initialize the thread-specific data key used for the mail message cache.

Returns:

true on success or false on failure.

Definition at line 33 of file cache.c.

References log_pedantic, and mail_cache_destroy().

Referenced by process_start().

5.89.1.6 void mail_cache_stop (void)

Destroy the thread-specific data key used for the mail message cache.

Returns:

This function returns no value.

Definition at line 47 of file cache.c.

References log_pedantic.

Referenced by process_stop().

5.89.1.7 void mail_cache_thread_stop (void)

Free the thread-specific data for the mail message cache.

Returns:

This function returns no value.

Definition at line 60 of file cache.c.

References mail_cache_destroy().

Referenced by thread_stop().

5.90 src/providers/consumers/cache.c File Reference

```
#include "magma.h"
```

Functions

- `bool_t lib_load_cache` (void)
Initialize the memcached library and bind dynamically to the exported functions that are required.
- `const char * lib_version_cache` (void)
Return the version string of the memcached library.
- `bool_t cache_start` (void)
- `void cache_stop` (void)
Destroy the memcached client pool and all active connections.
- `void cache_flush` (void)
- `stringer_t * cache_get` (stringer_t *key)
Retrieve data from memcached by key.
- `uint64_t cache_get_u64` (stringer_t *key)
Retrieve a 64 bit value from memcached by key.
- `int_t cache_set` (stringer_t *key, stringer_t *object, time_t expiration)
Set a value in memcached by key.
- `int_t cache_set_u64` (stringer_t *key, uint64_t value, time_t expiration)
Set a 64 bit value in memcached by key.
- `int_t cache_add` (stringer_t *key, stringer_t *object, time_t expiration)
Add a new key/value pair to the memcached server.
- `int_t cache_silent_add` (stringer_t *key, stringer_t *object, time_t expiration)
Add a new key/value pair to the memcached server; but suppress any error messages.
- `int_t cache_append` (stringer_t *key, stringer_t *object, time_t expiration)
Append data to the value of a cached key on a memcached server.
- `int_t cache_delete` (stringer_t *key)
Delete a key from memcached immediately.
- `uint64_t cache_increment` (stringer_t *key, uint64_t offset, uint64_t initial, time_t expiration)
Increment the value stored with a key by memcached by a specified offset.
- `uint64_t cache_decrement` (stringer_t *key, uint64_t offset, uint64_t initial, time_t expiration)
Decrement the value stored with a key inside memcached, using the specified offset.

Variables

- `pool_t * cache_pool` = NULL

5.90.1 Function Documentation

5.90.1.1 `int_t cache_add (stringer_t * key, stringer_t * object, time_t expiration)`

Add a new key/value pair to the memcached server. `cache.c`

Parameters:

key a managed string with the name of the key to be added to the cache.

object a managed string containing the initial value of the new key.

expiration an expiration time, in seconds, for the newly cached data.

Definition at line 278 of file `cache.c`.

References `cache_pool`, `log_info`, `memcached_add_d`, `memcached_strerror_d`, `PL_RESERVED`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

5.90.1.2 `int_t cache_append (stringer_t * key, stringer_t * object, time_t expiration)`

Append data to the value of a cached key on a memcached server.

Parameters:

key a managed string with the name of the target memcached key.

object a managed string containing the value of the data being appended to the original key.

expiration an expiration time, in seconds, for the modified cached data.

Definition at line 323 of file `cache.c`.

References `cache_pool`, `log_info`, `memcached_add_d`, `memcached_append_d`, `memcached_strerror_d`, `PL_RESERVED`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

Referenced by `stamp_counter_increment()`.

5.90.1.3 `uint64_t cache_decrement (stringer_t * key, uint64_t offset, uint64_t initial, time_t expiration)`

Decrement the value stored with a key inside memcached, using the specified offset.

See also:

`memcached_decrement_with_initial()`

Note:

If the expiration valuse is `MEMCACHED_EXPIRATION_NOT_ADD` the key won't be added, but the initial value will be used as the return value.

Parameters:

key a managed string containing the name of the memcached key to be adjusted.

offset the offset by which the specified key's value should be decremented.

initial the initial value to seed the key with it does not already exist.

expiration the time, in seconds, when the cached key will expire.

Returns:

0 on failure, or the newly decremented value associated with the key, or the initial value, on success.

Definition at line 415 of file cache.c.

References `cache_pool`, `log_pedantic`, `memcached_decrement_with_initial_d`, `memcached_strerror_d`, `PL_RESERVED`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

Referenced by `imap_login()`, `pop_pass()`, `smtp_auth_login()`, and `smtp_auth_plain()`.

5.90.1.4 `int_t cache_delete (stringer_t * key)`

Delete a key from memcached immediately.

Note:

`memcached_delete()`

Parameters:

key the name of the key to be deleted from the memcached server.

Returns:

0 on failure, or `MEMCACHED_SUCCESS` on success.

Definition at line 353 of file cache.c.

References `cache_pool`, `log_info`, `memcached_delete_d`, `memcached_strerror_d`, `PL_RESERVED`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `st_char_get()`, `st_empty`, `st_length_get()`, and `st_length_int()`.

Referenced by `lock_release()`.

5.90.1.5 `void cache_flush (void)`

Definition at line 124 of file cache.c.

References `cache_pool`, `log_info`, `memcached_flush_d`, `memcached_strerror_d`, `PL_RESERVED`, `pool_get_obj()`, `pool_pull()`, and `pool_release()`.

5.90.1.6 `stringer_t* cache_get (stringer_t * key)`

Retrieve data from memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

Returns:

NULL on failure, or a pointer to a managed string containing the cached data on success.

Definition at line 145 of file cache.c.

References `cache_pool`, `data`, `length`, `log_info`, `memcached_get_d`, `memcached_strerror_d`, `mm_free()`, `PL_RESERVED`, `pool_get_obj()`, `pool_pull()`, `pool_release()`, `st_char_get()`, `st_empty`, `st_import()`, `st_length_get()`, and `st_length_int()`.

Referenced by `register_session_get()`, `smtp_check_greylist()`, `smtp_fetch_autoreply()`, `stamp_counter_check()`, and `teacher_data_get()`.

5.90.1.7 `uint64_t cache_get_u64 (stringer_t * key)`

Retrieve a 64 bit value from memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

Returns:

NULL on failure, or the 64 bit value cached data on success.

Definition at line 185 of file cache.c.

References cache_pool, data, length, log_info, memcached_get_d, memcached_strerror_d, mm_free(), PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by contact_abuse_checks(), register_abuse_checks(), and smtp_reply().

5.90.1.8 uint64_t cache_increment (stringer_t * key, uint64_t offset, uint64_t initial, time_t expiration)

Increment the value stored with a key by memcached by a specified offset.

See also:

memcached_increment_with_initial()

Note:

If the expiration value is MEMCACHED_EXPIRATION_NOT_ADD the key won't be added, but the initial value will be used as the return value.

Parameters:

key a managed string containing the name of the memcached key to be adjusted.

offset the offset by which the specified key's value should be incremented.

initial the initial value to seed the key if it does not already exist.

expiration the time, in seconds, when the cached key will expire.

Returns:

0 on failure, or the newly incremented value associated with the key, or the initial value, on success.

Definition at line 381 of file cache.c.

References cache_pool, log_pedantic, memcached_increment_with_initial_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by api_endpoint_auth(), contact_abuse_increment_history(), imap_login(), pop_pass(), portal_endpoint_auth(), register_abuse_increment_history(), serial_get(), serial_increment(), smtp_auth_login(), and smtp_auth_plain().

5.90.1.9 int_t cache_set (stringer_t * key, stringer_t * object, time_t expiration)

Set a value in memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

object a managed string containing the new data to be associated with the supplied key.

expiration the expiration time of the cached data.

Returns:

0 on failure, or 1 on success.

Definition at line 231 of file cache.c.

References cache_pool, log_info, memcached_set_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by register_session_cache(), serial_reset(), smtp_check_greylist(), smtp_fetch_autoreply(), and teacher_data_save().

5.90.1.10 int_t cache_set_u64 (stringer_t * key, uint64_t value, time_t expiration)

Set a 64 bit value in memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

value the new value to be associated with the supplied key.

expiration the expiration time of the cached data.

Returns:

NULL on failure, or the retrieved unsigned 64 bit cached data on success.

Definition at line 255 of file cache.c.

References cache_pool, log_info, memcached_set_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by smtp_reply().

5.90.1.11 int_t cache_silent_add (stringer_t * key, stringer_t * object, time_t expiration)

Add a new key/value pair to the memcached server, but suppress any error messages.

Parameters:

key a managed string with the name of the key to be added to the cache.

object a managed string containing the initial value of the new key.

expiration an expiration time, in seconds, for the newly cached data.

Definition at line 301 of file cache.c.

References cache_pool, memcached_add_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, and st_length_get().

Referenced by lock_get().

5.90.1.12 bool_t cache_start (void)

Definition at line 45 of file cache.c.

References magma_t::cache, cache_pool, magma_t::iface, log_critical, magma, MAGMA_CACHE_INSTANCES, memcached_behavior_set_d, memcached_create_d, memcached_free_d, memcached_server_add_with_weight_d, memcached_strerror_d, pool_alloc(), and pool_set_obj().

Referenced by process_start().

5.90.1.13 void cache_stop (void)

Destroy the memcached client pool and all active connections.

Returns:

This function returns no value.

Definition at line 104 of file cache.c.

References magma_t::cache, cache_pool, magma_t::iface, magma, memcached_free_d, pool_free(), and pool_get_obj().

Referenced by process_stop().

5.90.1.14 bool_t lib_load_cache (void)

Initialize the memcached library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 16 of file cache.c.

References lib_symbols(), M_BIND, and symbol_t.

Referenced by lib_load().

5.90.1.15 const char* lib_version_cache (void)

Return the version string of the memcached library.

Returns:

a pointer to a character string containing the memcached library version information.

Definition at line 37 of file cache.c.

References memcached_lib_version_d.

Referenced by lib_load().

5.90.2 Variable Documentation**5.90.2.1 pool_t* cache_pool = NULL**

Definition at line 10 of file cache.c.

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), cache_start(), and cache_stop().

Functions

- [cached_store_t * _get_cached_store_by_type](#) (cached_data_type_t dtype)
Get a pointer to a cached object store by its type.
- [char * _get_dime_dir_location](#) (const char *suffix)
Get the full pathname of the DIME base directory.
- [char * _get_cache_location](#) (void)
Get the full pathname of the DIME cache file.
- [int _set_cache_location](#) (const char *path)
Set the pathname of the DIME management record cache file.
- [cached_object_t * _create_cached_object](#) (cached_data_type_t dtype, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)
Allocate and initialize a new cached object.
- [void * _get_cache_obj_data](#) (cached_object_t *object)
Get the data associated with a cached object, freeing the parent cached object.
- [void _destroy_cache_entry](#) (cached_object_t *entry)
Destroy a cached object.
- [cached_object_t * _find_cached_object](#) (const char *oid, cached_store_t *store)
Find a cached object in a cached store.
- [cached_object_t * _find_cached_object_cmp](#) (const void *key, cached_store_t *store, cached_store_comparator_t cmpfn)
Find a cached object in a cached store using a custom comparator.
- [int _cached_object_exists](#) (const unsigned char *hashid, cached_store_t *store)
Check by a cached object's hashed id to see if it already exists in a cached object store.

- `int _cached_object_exists_cmp` (const void *key, `cached_store_t` *store, `cached_store_comparator_t` cmpfn)
Check to see if an object exists in a cached store by using a custom comparator function.
- `cached_object_t * _add_cached_object` (const char *id, `cached_store_t` *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)
Create and add a cached object to a cached store.
- `cached_object_t * _add_cached_object_forced` (const char *id, `cached_store_t` *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)
Create and add an object to the cache, forcing the removal of any existing object with a clashing id.
- `cached_object_t * _add_cached_object_cmp` (const char *id, const void *key, `cached_store_t` *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed, `cached_store_comparator_t` cmpfn)
Create and add a cached object to a cached store using a custom comparator check for collisions.
- `cached_object_t * _add_cached_object_cmp_forced` (const char *id, const void *key, `cached_store_t` *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed, `cached_store_comparator_t` cmpfn)
Create and add an object to the cache, forcing the removal of any existing object that matches the result of a custom comparison function.
- `int _remove_cached_object` (const char *oid, `cached_store_t` *store)
Remove an object from a cached store by name.
- `int _remove_cached_object_cmp` (const void *key, `cached_store_t` *store, `cached_store_comparator_t` cmpfn)
Remove an object from a cached store using a custom comparator function.
- `cached_object_t * _clone_cached_object` (const `cached_object_t` *obj)
Clone a deep copy of a cached object for user-safe retrieval.
- `void _dump_cache` (`cached_data_type_t` dtype, int do_data, int ephemeral)
Dump the content of the specified data cached store(s) to the console.
- `void _dump_cache_data` (FILE *fp, const `cached_object_t` *obj, int brief)
Dump information about a specified cached object to a file stream.
- `int _load_cache_contents` (void)
Persist the entire contents of the cache to local storage.
- `int _save_cache_contents` (void)
Persist the entire contents of the cache to local storage.
- `int _set_cache_permissions` (unsigned long flags)
Set the permissions flags for the object cache.
- `size_t _mem_append_serialized` (unsigned char **buf, size_t *blen, const unsigned char *data, size_t dlen)
Append a variable-length chunk of data to a dynamically allocated buffer for serialization.
- `size_t _mem_append_serialized_string` (unsigned char **buf, size_t *blen, const char *string)
Append a null-terminated string to a dynamically allocated buffer for serialization.
- `size_t _mem_append_serialized_array` (unsigned char **buf, size_t *blen, const unsigned char **array, size_t itemsize)
Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

- `size_t _mem_append_serialized_str_array` (unsigned char **buf, size_t *blen, const char **array)
Append an array of null-terminated strings to a dynamically allocated buffer for serialization.
- `size_t _mem_append_serialized_array_cb` (unsigned char **buf, size_t *blen, const char **array, `custom_serializer_t` sfn)
Append an array of custom-formatted data to a dynamically allocated buffer for serialization.
- `unsigned int _deserialize_data` (unsigned char *dst, unsigned char **bufptr, const unsigned char *bufend, size_t len)
Deserialize a fixed-sized chunk of data from an input buffer.
- `unsigned char * _deserialize_vardata` (unsigned char **bufptr, const unsigned char *bufend, size_t *olen)
Deserialize a variable-length chunk of data from an input buffer.
- `unsigned int _deserialize_string` (char **dst, unsigned char **bufptr, const unsigned char *bufend)
Deserialize a null-terminated string from an input buffer.
- `unsigned int _deserialize_array` (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, size_t itemsize)
Deserialize an array of fixed-size objects from an input buffer.
- `unsigned int _deserialize_str_array` (char ***dst, unsigned char **bufptr, const unsigned char *bufend)
Deserialize an array of null-terminated string from an input buffer.
- `unsigned int _deserialize_array_cb` (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, `custom_deserializer_t` dfn)
Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.
- `int _is_object_expired` (`cached_object_t` *obj, int *refresh)
Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.
- `cached_object_t * _unlink_object` (`cached_object_t` *object, int destroy, int stale)
Unlink a cached object from its doubly linked list.
- `cached_object_t * _replace_object` (`cached_object_t` *oobj, `cached_object_t` *nobj, int shadow)
Replace one object in the cache with another.
- `void _lock_cache_store` (`cached_store_t` *store)
Lock a cached store for thread-safe processing.
- `void _unlock_cache_store` (`cached_store_t` *store)
Unlock a cached store for use by other callers.
- `unsigned int _evict_if_stale` (`cached_object_t` **objptr)
Evict an item from the object cache if it is stale (has expired).
- `void * _deserialize_signet_cb` (void *data, size_t len)
Deserializes signet from a void pointer.
- `void * _serialize_signet_cb` (void *record, size_t *outlen)
Serializes a `signet_t` structure into a binary string.
- `void _dump_signet_cb` (FILE *fp, void *record, int brief)
Dumps a signet from a `signet_t` structure.
- `void _destroy_signet_cb` (void *record)
Destroys a `signet_t` structure.

Variables

- `cached_store_t cached_stores` [cached_data_signet+1]

5.91.1 Function Documentation

5.91.1.1 `cached_object_t* _add_cached_object (const char *id, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)`

Create and add a cached object to a cached store.

Parameters:

id a unique identifier to be associated with the cached object in the store.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 556 of file cache.c.

References `_clone_cached_object()`, `_compute_sha_hash()`, `_evict_if_stale()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_ADD`, `cached_object::data`, `cached_store_t::dtype`, `cached_object::dtype`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_PERM`, `ERR_UNSPEC`, `cached_object::expiration`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `cached_object::persists`, `cached_object::prev`, `PUSH_ERROR_SYSCALL`, `cached_object::relaxed`, `RET_ERROR_PTR`, `RET_ERROR_PTR_FMT`, `SHA_256_SIZE`, `cached_object::timestamp`, and `cached_object::ttl`.

Referenced by `_add_cached_object_forced()`, `_do_ocsp_validation()`, `_get_dime_record()`, and `_get_signet()`.

5.91.1.2 `cached_object_t* _add_cached_object_cmp (const char *id, const void *key, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed, cached_store_comparator_t cmpfn)`

Create and add a cached object to a cached store using a custom comparator check for collisions.

Parameters:

id a unique identifier to be associated with the cached object in the store.

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cache dstore and determine whether the two objects match one another.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 741 of file cache.c.

References `_clone_cached_object()`, `_compute_sha_hash()`, `_create_cached_object()`, `_evict_if_stale()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_ADD`, `cached_object::data`, `cached_store_t::dtype`, `ERR_BAD_PARAM`, `ERR_PERM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `cached_object::prev`, `RET_ERROR_PTR`, and `SHA_256_SIZE`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_dnskey_entry_rsa()`, and `_add_ds_entry()`.

5.91.1.3 `cached_object_t* _add_cached_object_cmp_forced (const char *id, const void *key, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed, cached_store_comparator_t cmpfn)`

Create and add an object to the cache, forcing the removal of any existing object that matches the result of a custom comparison function.

Parameters:

id a unique identifier to be associated with the cached object in the store.

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cache dstore and determine whether the two objects match one another.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 835 of file cache.c.

References `_add_cached_object_cmp()`, `_clone_cached_object()`, `_create_cached_object()`, `_dbgprint()`, `_destroy_cache_entry()`, `_dump_cache_data()`, `_find_cached_object()`, `_find_cached_object_cmp()`, `_replace_object()`, `_verbose`, `CACHE_PERM_ADD`, `cached_object::data`, `cached_store_t::dtype`, `ERR_BAD_PARAM`, `ERR_PERM`, `ERR_UNSPEC`, and `RET_ERROR_PTR`.

Referenced by `_add_dnskey_entry_rsa()`.

5.91.1.4 `cached_object_t* _add_cached_object_forced (const char *id, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)`

Create and add an object to the cache, forcing the removal of any existing object with a clashing id.

Note:

If an object with the same identifier already exists, it will be stored as the "shadow" data of the newly created cached entry. This allows for shadowed data to be saved to disk on a cache save, even if the over-shadowing data is not marked as persistent.

Parameters:

id a unique identifier to be associated with the cached object in the store.

store a pointer to the cached store that will hold the new cached object.

tll an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 662 of file cache.c.

References `_add_cached_object()`, `_clone_cached_object()`, `_create_cached_object()`, `_dbgprint()`, `_destroy_cache_entry()`, `_dump_cache_data()`, `_find_cached_object()`, `_replace_object()`, `_verbose`, `CACHE_PERM_ADD`, `cached_object::data`, `cached_store_t::dtype`, `ERR_BAD_PARAM`, `ERR_PERM`, `ERR_UNSPEC`, and `RET_ERROR_PTR`.

Referenced by `_get_dime_record_from_file()`.

5.91.1.5 `int _cached_object_exists (const unsigned char * hashid, cached_store_t * store)`

Check by a cached object's hashed id to see if it already exists in a cached object store.

Parameters:

store a pointer to the cached store in which to search for the cached object.

hashid the (already) hashed unique id of the object to be located in the cache.

Returns:

1 if the object described was present in the cache, 0 if it was not, or -1 on error.

Definition at line 460 of file cache.c.

References `_evict_if_stale()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_READ`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `RET_ERROR_INT`, and `SHA_256_SIZE`.

Referenced by `_load_cache_contents()`.

5.91.1.6 `int _cached_object_exists_cmp (const void * key, cached_store_t * store, cached_store_comparator_t cmpfn)`

Check to see if an object exists in a cached store by using a custom comparator function.

Note:

This function is used when the simple unique object ID is not enough to identify an object.

Parameters:

key a pointer to an object-specific key that will be passed to the comparison function.

store a pointer to the cached store in which to search for the cached object.

cmpfn a comparison function that will compare the key value to the objects in the specified cached store, and determine whether the two objects match one another.

Returns:

1 if the object described was present in the cache, 0 if it was not, or -1 on error.

Definition at line 506 of file cache.c.

References `_evict_if_stale()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_READ`, `cached_object::data`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::next`, and `RET_ERROR_INT`.

5.91.1.7 `cached_object_t* _clone_cached_object (const cached_object_t * obj)`

Clone a deep copy of a cached object for user-safe retrieval.

Definition at line 994 of file `cache.c`.

References `_get_cached_store_by_type()`, `cached_store_t::clone`, `cached_object::data`, `data`, `cached_store_t::deserialize`, `cached_object::dtype`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `cached_object::expiration`, `cached_object::id`, `cached_store_t::internal`, `cached_object::persists`, `PUSH_ERROR_SYSCALL`, `cached_object::relaxed`, `RET_ERROR_PTR`, `cached_store_t::serialize`, `store`, `cached_object::timestamp`, and `cached_object::ttl`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_find_cached_object()`, and `_find_cached_object_cmp()`.

5.91.1.8 `cached_object_t* _create_cached_object (cached_data_type_t dtype, unsigned long ttl, time_t expiration, void * data, int persists, int relaxed)`

Allocate and initialize a new cached object.

See also:

[`_add_cached_object\(\)`](#)

Note:

The data parameter specifies an object-specific value that will be passed to other parts of the cache management subsystem, such as functions for deletion, destruction, search, etc.

Parameters:

dtype the data type identifying the cached store to which this cached object will belong.

ttl if not 0, an optional time-to-live value in seconds specifying in how many seconds from now the cached object will reach expiration.

expiration if not 0, an optional UTC time value specifying the exact time at which this cached object will reach expiration.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy. A relaxed cache policy ensures that even if the entry's ttl has expired, if its absolute (UTC) expiration time has not been reached, it will not be evicted from the cache, but will allow for a notification to the caller that it is time for the cached entry to be refreshed.

Returns:

a pointer to a newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 244 of file `cache.c`.

References `cached_object::data`, `cached_object::dtype`, `ERR_NOMEM`, `ERR_UNSPEC`, `cached_object::expiration`, `cached_object::persists`, `PUSH_ERROR_SYSCALL`, `cached_object::relaxed`, `RET_ERROR_PTR`, `cached_object::timestamp`, and `cached_object::ttl`.

Referenced by `_add_cached_object_cmp()`, `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, and `_get_dime_record()`.

5.91.1.9 `unsigned int _deserialize_array (unsigned char *** dst, unsigned char ** bufptr, const unsigned char * bufend, size_t itemsize)`

Deserialize an array of fixed-size objects from an input buffer.

Note:

This is the inverse function of [`_mem_append_serialized_array\(\)`](#).

Parameters:

- dst* a pointer to the address of an array of objects that will receive a copy of the deserialized data as an array of (NULL pointer terminated) fixed-size objects on success.
- bufptr* a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.
- bufend* a pointer to the end of the input buffer for validation purposes.
- itemsz* the size, in bytes, of the fixed-sized objects to be deserialized.

Returns:

1 on success or 0 on failure.

Definition at line 1876 of file cache.c.

References `_deserialize_data()`, `_ptr_chain_add()`, `_ptr_chain_free()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, and `RET_ERROR_UINT`.

Referenced by `_deserialize_dime_record_cb()`.

5.91.1.10 `unsigned int _deserialize_array_cb (unsigned char *** dst, unsigned char ** bufptr, const unsigned char * bufend, custom_deserializer_t dfn)`

Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.

Note:

This is the inverse function of [_mem_append_serialized_array_cb\(\)](#).

Parameters:

- dst* a pointer to the address of an array of data buffers that will receive a copy of the deserialized data as an array of (NULL pointer terminated) data buffers on success.
- bufptr* a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.
- bufend* a pointer to the end of the input buffer for validation purposes.
- dfn* a custom deserialization function that will be used to deserialize the user data from the input buffer.

Returns:

1 on success or 0 on failure.

Definition at line 2025 of file cache.c.

References `_deserialize_data()`, `_ptr_chain_add()`, `_ptr_chain_free()`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, and `RET_ERROR_UINT`.

5.91.1.11 `unsigned int _deserialize_data (unsigned char * dst, unsigned char ** bufptr, const unsigned char * bufend, size_t len)`

Deserialize a fixed-sized chunk of data from an input buffer.

Note:

This is the inverse function of [_mem_append\(\)](#); *dst* must be at least *len* bytes long.

Parameters:

- dst* a pointer to the output buffer that will receive the deserialized data.
- bufptr* a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

len the size of the data chunk to be deserialized from the input buffer.

Returns:

1 on success or 0 on failure.

Definition at line 1755 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_UINT, and RET_ERROR_UINT_FMT.

Referenced by _deserialize_array(), _deserialize_array_cb(), _deserialize_dime_record_cb(), _deserialize_dnskey_record_cb(), _deserialize_ds_record_cb(), _deserialize_str_array(), and _deserialize_vardata().

5.91.1.12 void* _deserialize_signet_cb (void * data, size_t len)

Deserializes signet from a void pointer.

Parameters:

data Pointer to serial signet data.

len Length of serial signet data.

Returns:

Void pointer to a [signet_t](#) structure.

Definition at line 2321 of file cache.c.

References dime_sgnt_signet_binary_deserialize(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_PTR.

5.91.1.13 unsigned int _deserialize_str_array (char *** dst, unsigned char ** bufptr, const unsigned char * bufend)

Deserialize an array of null-terminated string from an input buffer.

Note:

This is the inverse function of [_mem_append_serialized_str_array\(\)](#).

Parameters:

dst a pointer to the address of an array of strings that will receive a copy of the deserialized data as an array of (NULL pointer terminated) null-terminated strings on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1955 of file cache.c.

References _deserialize_data(), _deserialize_string(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_UINT.

Referenced by _deserialize_dime_record_cb().

5.91.1.14 unsigned int _deserialize_string (char ** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)

Deserialize a null-terminated string from an input buffer.

Note:

This is the inverse function of [_mem_append_serialized_string\(\)](#).

Parameters:

dst a pointer to the address of a string that will receive a copy of the deserialized data as a null-terminated string on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1826 of file cache.c.

References `ERR_BAD_PARAM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, and `RET_ERROR_UINT`.

Referenced by `_deserialize_dime_record_cb()`, `_deserialize_dnskey_record_cb()`, `_deserialize_ds_record_cb()`, and `_deserialize_str_array()`.

5.91.1.15 unsigned char* _deserialize_vardata (unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t * *olen*)

Deserialize a variable-length chunk of data from an input buffer.

Note:

This is the inverse function of `_mem_append_serialized`.

Parameters:

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

olen an optional pointer to receive the size of the deserialized data on success.

Returns:

a pointer to a newly allocated buffer containing the deserialized data on success, or NULL on failure.

Definition at line 1784 of file cache.c.

References `_deserialize_data()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_PTR`, and `RET_ERROR_UINT`.

Referenced by `_deserialize_dnskey_record_cb()`, and `_deserialize_ds_record_cb()`.

5.91.1.16 void _destroy_cache_entry (cached_object_t * *entry*)

Destroy a cached object.

Parameters:

entry a pointer to the cached object to be destroyed.

Definition at line 316 of file cache.c.

References `_clear_error_stack()`, `_get_cached_store_by_type()`, `cached_object::data`, `cached_store_t::destructor`, `cached_object::dtype`, `dump_error_stack()`, `get_last_error()`, and `store`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_get_cache_obj_data()`, `_get_dime_record()`, `_load_cache_contents()`, and `_replace_object()`.

5.91.1.17 `void _destroy_signet_cb (void * record)`

Destroys a [signet_t](#) structure.

Parameters:

record Void pointer to a [signet_t](#) structure to be destroyed.

Definition at line 2399 of file cache.c.

References `dime_sgnt_signet_destroy()`.

5.91.1.18 `void _dump_cache (cached_data_type_t dtype, int do_data, int ephemeral)`

Dump the content of the specified data cached store(s) to the console.

Parameters:

dtype the type of the object cached store to be dumped, or `cached_data_unknown` for all stores.

do_data if non-zero, dump the type-specific data associated with the cached object.

ephemeral if non-zero, print out ephemeral as well as persistent cache data.

Definition at line 1068 of file cache.c.

References `_dump_cache_data()`, `_get_chr_date()`, `_lock_cache_store()`, `_unlock_cache_store()`, `cached_data_unknown`, `cached_object::data`, `cached_store_t::dtype`, `cached_object::expiration`, `cached_object::next`, `cached_object::persists`, `cached_object::relaxed`, `cached_object::shadow`, `cached_object::timestamp`, and `cached_object::ttl`.

5.91.1.19 `void _dump_cache_data (FILE * fp, const cached_object_t * obj, int brief)`

Dump information about a specified cached object to a file stream.

Parameters:

fp a pointer to the file stream across which the data should be dumped.

obj a pointer to the cached object to have its details dumped.

brief if true, print a brief one-line description of the object; otherwise, dump full object information.

Definition at line 1163 of file cache.c.

References `_clear_error_stack()`, `_get_cached_store_by_type()`, `cached_object::data`, `cached_object::dtype`, `cached_store_t::dump`, `dump_error_stack()`, `get_last_error()`, and `store`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_dump_cache()`, `_load_cache_contents()`, and `_unlink_object()`.

5.91.1.20 `void _dump_signet_cb (FILE * fp, void * record, int brief)`

Dumps a signet from a [signet_t](#) structure.

Parameters:

fp File descriptor that specifies the output destination.
record Void pointer to a [signet_t](#) structure.
brief TODO

Definition at line 2377 of file cache.c.

References `dime_sgnt_signet_dump()`.

5.91.1.21 unsigned int _evict_if_stale (cached_object_t ** objptr)

Evict an item from the object cache if it is stale (has expired).

Returns:

1 if the object was evicted for being stale or 0 if it was not.

Definition at line 2287 of file cache.c.

References `_clear_error_stack()`, `_is_object_expired()`, `_unlink_object()`, `dump_error_stack()`, and `get_last_error()`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_cached_object_exists()`, `_cached_object_exists_cmp()`, `_find_cached_object()`, `_find_cached_object_cmp()`, `_remove_cached_object()`, and `_remove_cached_object_cmp()`.

5.91.1.22 cached_object_t* _find_cached_object (const char * oid, cached_store_t * store)

Find a cached object in a cached store.

Parameters:

oid a null-terminated string containing the unique name or identifier of the cached object.
store a pointer to the cached store to be searched for the target object.

Returns:

a pointer to the specified cached object, if found, or NULL on failure.

Definition at line 355 of file cache.c.

References `_clone_cached_object()`, `_compute_sha_hash()`, `_evict_if_stale()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_READ`, `ERR_BAD_PARAM`, `ERR_PERM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `RET_ERROR_PTR`, and `SHA_256_SIZE`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_do_ocsp_validation()`, `_get_dime_record()`, and `_get_signet()`.

5.91.1.23 cached_object_t* _find_cached_object_cmp (const void * key, cached_store_t * store, cached_store_comparator_t cmpfn)

Find a cached object in a cached store using a custom comparator.

Note:

This function is used when the simple unique object ID is not sufficient to identify an object.

Parameters:

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store in which to search for the cached object.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cached store and determine whether the two objects match one another.

Returns:

a pointer to the found cached object on success, or NULL on failure.

Definition at line 412 of file cache.c.

References `_clone_cached_object()`, `_evict_if_stale()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_READ`, `cached_object::data`, `ERR_BAD_PARAM`, `ERR_PERM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::next`, and `RET_ERROR_PTR`.

Referenced by `_add_cached_object_cmp_forced()`, `_get_dnskey_by_tag()`, `_get_ds_by_dnskey()`, and `_load_dnskey_file()`.

5.91.1.24 `char* _get_cache_location (void)`

Get the full pathname of the DIME cache file.

Note:

The default location returned by this function can be overridden by setting the `DIME_CACHE_FILE` environment variable.

Returns:

NULL on failure, or a null-terminated string containing the filename of the DIME object cache file on success. {free}

Definition at line 154 of file cache.c.

References `_dbgprint()`, `_get_dime_dir_location()`, `ERR_NOMEM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, and `RET_ERROR_PTR`.

Referenced by `_load_cache_contents()`, and `_save_cache_contents()`.

5.91.1.25 `void* _get_cache_obj_data (cached_object_t * object)`

Get the data associated with a cached object, freeing the parent cached object.

Note:

This function is useful as a wrapper for returning cached data without returning the meta-information associated with the same data that is stored inside its `cached_object_t` holder. If the object belongs to an internal store, no memory will be freed.

Parameters:

object a pointer to the cached object to have its opaque data returned, and enclosing structure freed.

Returns:

NULL on failure, or a pointer to the cached object's data on success.

Definition at line 281 of file cache.c.

References `_destroy_cache_entry()`, `_get_cached_store_by_type()`, `cached_object::data`, `cached_object::dtype`, `ERR_UNSPEC`, `cached_store_t::internal`, `RET_ERROR_PTR`, and `store`.

Referenced by `_add_dnskey_entry_rsa()`, `_add_ds_entry()`, `_get_dime_record()`, `_get_dime_record_from_file()`, `_get_dnskey_by_tag()`, `_get_ds_by_dnskey()`, and `_get_signet()`.

5.91.1.26 `cached_store_t* _get_cached_store_by_type (cached_data_type_t dtype)`

Get a pointer to a cached object store by its type.

Parameters:

dtype the numerical identifier of the cached data type.

Returns:

a pointer to the requested cached object store on success, or NULL on failure.

Definition at line 46 of file cache.c.

Referenced by `_clone_cached_object()`, `_destroy_cache_entry()`, `_dump_cache_data()`, `_get_cache_obj_data()`, `_load_cache_contents()`, `_replace_object()`, and `_unlink_object()`.

5.91.1.27 `char* _get_dime_dir_location (const char * suffix)`

Get the full pathname of the DIME base directory.

Parameters:

suffix if not NULL, an optional suffix containing a filename or path to be appended to the end of the DIME directory name.

Returns:

NULL on failure, or a null-terminated string containing the requested DIME directory pathname on success.

Definition at line 61 of file cache.c.

References `ERR_NOMEM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_PTR`, and `str_printf()`.

Referenced by `_get_cache_location()`, `_initialize_resolver()`, and `_ssl_initialize()`.

5.91.1.28 `int _is_object_expired (cached_object_t * obj, int * refresh)`

Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.

Note:

An object has "expired" and needs to be evicted from the cache if it has a non-zero TTL from its cache date that has been reached, or a non-zero absolute expiration date that has been exceeded. If the object's cache policy is relaxed, a TTL expiration advises a "refresh" if no absolute expiration has occurred.

Parameters:

obj a pointer to the cached object to have its age examined.

refresh an optional pointer to a value that, if the cached object has a relaxed expiration policy, will be set to 1 if it needs to be refreshed or 0 if it does not.

Returns:

1 if the object has expired or 0 if it has not; -1 if a general error has occurred.

Definition at line 2093 of file cache.c.

References `ERR_BAD_PARAM`, `ERR_UNSPEC`, `cached_object::expiration`, `PUSH_ERROR_SYSCALL`, `cached_object::relaxed`, `RET_ERROR_INT`, `cached_object::timestamp`, and `cached_object::ttl`.

Referenced by `_evict_if_stale()`, and `_get_dime_record()`.

5.91.1.29 int _load_cache_contents (void)

Persist the entire contents of the cache to local storage.

Returns:

1 if the cache was loaded successfully, 0 if it was created, or -1 on general failure.

Definition at line 1196 of file cache.c.

References `_cached_object_exists()`, `_clear_error_stack()`, `_dbgprint()`, `_destroy_cache_entry()`, `_dump_cache_data()`, `_get_cache_location()`, `_get_cached_store_by_type()`, `_get_chr_date()`, `_lock_cache_store()`, `_unlock_cache_store()`, `_verbose`, `CACHE_PERM_LOAD`, `cached_object::data`, `cached_store_t::deserialize`, `cached_object::dtype`, `dump_error_stack()`, `ERR_NOMEM`, `ERR_PERM`, `ERR_UNSPEC`, `cached_object::expiration`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `cached_object::persists`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_INT`, `store`, `cached_object::timestamp`, and `cached_object::ttl`.

5.91.1.30 void _lock_cache_store (cached_store_t * store)

Lock a cached store for thread-safe processing.

Parameters:

store a pointer to the cached store to be locked.

Definition at line 2261 of file cache.c.

References `cached_store_t::lock`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_cached_object_exists()`, `_cached_object_exists_cmp()`, `_dump_cache()`, `_find_cached_object()`, `_find_cached_object_cmp()`, `_fixup_dnskey_validation()`, `_load_cache_contents()`, `_remove_cached_object()`, `_remove_cached_object_cmp()`, and `_save_cache_contents()`.

5.91.1.31 size_t _mem_append_serialized (unsigned char ** buf, size_t * blen, const unsigned char * data, size_t dlen)

Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

data a pointer to a buffer holding the data that will be appended to the end of the output buffer.

dlen the size, in bytes, of the data buffer to be appended to the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1524 of file cache.c.

References `_mem_append()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_mem_append_serialized_array()`, `_mem_append_serialized_array_cb()`, `_mem_append_serialized_str_array()`, `_serialize_dnskey_record_cb()`, and `_serialize_ds_record_cb()`.

5.91.1.32 size_t _mem_append_serialized_array (unsigned char ** buf, size_t * blen, const unsigned char ** array, size_t itemsz)

Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
array an array of pointers to fixed-size objects (ending with a NULL pointer) to be appended to the end of the output buffer.
*itemsiz*e the size, in bytes, of the array elements to be deserialized.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1585 of file cache.c.

References `_mem_append()`, `_mem_append_serialized()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_serialize_dime_record_cb()`.

5.91.1.33 `size_t _mem_append_serialized_array_cb (unsigned char ** buf, size_t * blen, const char ** array, custom_serializer_t sfn)`

Append an array of custom-formatted data to a dynamically allocated buffer for serialization.

Note:

This function uses a custom serialization function in order to output the user data properly.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
array an array of pointers to custom-formatted data buffers (ending with a NULL pointer) to be appended to the end of the output buffer using a custom serialization function.
sfn a custom serialization function that will be used to serialize the user data into the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1698 of file cache.c.

References `_mem_append()`, `_mem_append_serialized()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

5.91.1.34 `size_t _mem_append_serialized_str_array (unsigned char ** buf, size_t * blen, const char ** array)`

Append an array of null-terminated strings to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
array an array of pointers to null-terminated strings (ending with a NULL pointer) to be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1640 of file cache.c.

References `_mem_append()`, `_mem_append_serialized()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_serialize_dime_record_cb()`.

5.91.1.35 `size_t _mem_append_serialized_string (unsigned char ** buf, size_t * blen, const char * string)`

Appended a null-terminated string to a dynamically allocated buffer for serialization.

Parameters:

- buf* a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
- blen* a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
- string* a null-terminated string that will be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1552 of file cache.c.

References `_mem_append()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_serialize_dime_record_cb()`, `_serialize_dnskey_record_cb()`, and `_serialize_ds_record_cb()`.

5.91.1.36 `int _remove_cached_object (const char * oid, cached_store_t * store)`

Remove an object from a cached store by name.

Note:

The caller is still responsible for freeing the cached object and its underlying data.

Parameters:

- oid* the unique identifier of the cached object to be removed.
- store* a pointer to the cached store from which the specified object will be removed.

Returns:

1 if the object was successfully removed or 0 if it couldn't be found; -1 on general error.

Definition at line 903 of file cache.c.

References `_compute_sha_hash()`, `_evict_if_stale()`, `_lock_cache_store()`, `_unlink_object()`, `_unlock_cache_store()`, `CACHE_PERM_DELETE`, `ERR_BAD_PARAM`, `ERR_PERM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `RET_ERROR_INT`, and `SHA_256_SIZE`.

5.91.1.37 `int _remove_cached_object_cmp (const void * key, cached_store_t * store, cached_store_comparator_t cmpfn)`

Remove an object from a cached store using a custom comparator function.

Note:

The caller is still responsible for freeing the cached object and its underlying data.

Parameters:

- key* a pointer to an object-specific key that will be passed to the custom comparison function.
- store* a pointer to the cached store from which the specified object will be removed.
- cmpfn* a custom comparison function that will compare the key value to the objects in the specified cached store and determine whether the two objects match one another.

Returns:

1 if the object was successfully removed or 0 if it couldn't be found; -1 on general error.

Definition at line 953 of file cache.c.

References `_evict_if_stale()`, `_lock_cache_store()`, `_unlink_object()`, `_unlock_cache_store()`, `CACHE_PERM_DELETE`, `cached_object::data`, `ERR_BAD_PARAM`, `ERR_PERM`, `cached_store_t::head`, `cached_object::next`, and `RET_ERROR_INT`.

5.91.1.38 `cached_object_t* _replace_object (cached_object_t * oobj, cached_object_t * nobj, int shadow)`

Replace one object in the cache with another.

Note:

If shadow is not set, then the old cached object will be automatically destroyed. Otherwise this function also makes the old cached object the new cached object's "shadow" data.

Parameters:

oobj a pointer to the old cached object to be replaced in its cached store with the new object.

nobj a pointer to the new cached object that will replace the old object in the cached store.

shadow if set, preserve the old object as the "shadow" value of the new object.

Returns:

NULL on failure, or a pointer to the new cached object on success.

Definition at line 2208 of file cache.c.

References `_destroy_cache_entry()`, `_get_cached_store_by_type()`, `cached_object::dtype`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `cached_object::prev`, `RET_ERROR_PTR`, `SHA_256_SIZE`, `cached_object::shadow`, and `store`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, and `_get_dime_record()`.

5.91.1.39 `int _save_cache_contents (void)`

Persist the entire contents of the cache to local storage.

Returns:

0 on success or -1 on failure.

Definition at line 1414 of file cache.c.

References `_clear_error_stack()`, `_dbgprint()`, `_get_cache_location()`, `_lock_cache_store()`, `_unlock_cache_store()`, `CACHE_PERM_LOAD`, `cached_object::data`, `dump_error_stack()`, `ERR_PERM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::next`, `cached_object::persists`, `PUSH_ERROR_FMT`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_INT`, and `cached_object::shadow`.

Referenced by `_do_ocsp_validation()`, and `_get_signet()`.

5.91.1.40 `void* _serialize_signet_cb (void * record, size_t * outlen)`

Serializes a [signet_t](#) structure into a binary string.

Parameters:

record Void pointer to a [signet_t](#) structure to be serialized.

outlen Pointer to the length of the returned string.

Returns:

Pointer to a serialized signet.

Definition at line 2343 of file cache.c.

References dime_sgnt_signet_binary_serialize(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.91.1.41 int _set_cache_location (const char * *path*)

Set the pathname of the DIME management record cache file.

Parameters:

path a null-terminated string containing the fully qualified path of the cache file to be used.

Returns:

0 on success or -1 on failure.

Definition at line 199 of file cache.c.

References _dbgprint(), ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

5.91.1.42 int _set_cache_permissions (unsigned long *flags*)

Set the permissions flags for the object cache.

Parameters:

flags

Returns:

-1 on error or 0 if the permissions were set successfully.

Definition at line 1503 of file cache.c.

References CACHE_PERM_ALL_FLAGS, ERR_BAD_PARAM, and RET_ERROR_INT.

5.91.1.43 cached_object_t* _unlink_object (cached_object_t * *object*, int *destroy*, int *stale*)

Unlink a cached object from its doubly linked list.

Parameters:

object a pointer to the cached object to be delinked.

destroy if set, deallocate the specified cached object after unlinking.

stale if set, the cache removal was performed because of a stale entry.

Returns:

a pointer to the next cached object in the store, or NULL if at the end of the store.

Definition at line 2140 of file cache.c.

References `_clear_error_stack()`, `_dbgprint()`, `_dump_cache_data()`, `_get_cached_store_by_type()`, `_verbose`, `cached_object::data`, `cached_store_t::destructor`, `cached_object::dtype`, `cached_store_t::dump`, `dump_error_stack()`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `get_last_error()`, `cached_store_t::head`, `cached_object::next`, `cached_object::prev`, `RET_ERROR_PTR`, and `store`.

Referenced by `_do_ocsp_validation()`, `_evict_if_stale()`, `_remove_cached_object()`, and `_remove_cached_object_cmp()`.

5.91.1.44 void _unlock_cache_store (cached_store_t * store)

Unlock a cached store for use by other callers.

Parameters:

store a pointer to the cached store to be unlocked.

Definition at line 2274 of file cache.c.

References `cached_store_t::lock`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_cached_object_exists()`, `_cached_object_exists_cmp()`, `_dump_cache()`, `_find_cached_object()`, `_find_cached_object_cmp()`, `_fixup_dnskey_validation()`, `_load_cache_contents()`, `_remove_cached_object()`, `_remove_cached_object_cmp()`, and `_save_cache_contents()`.

5.91.2 Variable Documentation

5.91.2.1 cached_store_t cached_stores[cached_data_signet+1]

Initial value:

```

Log all cache key information to be returned via "magma -h".

5.92.1 Function Documentation

5.92.1.1 [cache_t](#)* [cache_alloc](#) (uint32_t *number*)

Allocate a new cache server configuration entry and initialize it to its default values.

Parameters:

number the index of the cache server instance in the global cache server array.

Returns:

NULL on failure, or a pointer to the requested cache server configuration entry on success.

Definition at line 64 of file `cache.c`.

References `magma_t::cache`, `cache_keys`, `cache_set_value()`, `magma_t::iface`, `log_critical`, `magma`, and `mm_alloc()`.

Referenced by `cache_config()`.

5.92.1.2 bool_t cache_config (stringer_t * name, stringer_t * value)

Set the value of a cache server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new cache server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable cache server configuration parameter to be set.

value a managed string containing the new value of the cache server config key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 425 of file cache.c.

References bracket_extract_pl(), cache_alloc(), cache_keys, cache_set_value(), CONSTANT, log_critical, MAGMA_CACHE_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.92.1.3 void cache_free (void)

Free magma's cache server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 17 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, mm_free(), cache_keys_t::norm, ns_empty(), ns_free(), cache_keys_t::offset, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.92.1.4 void cache_output_help (void)

Log all cache key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 484 of file cache.c.

References multi_t::bl, cache_keys, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, cache_keys_t::norm, cache_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.92.1.5 void cache_output_settings (void)

Log the full contents of the magma cache configuration settings.

Note:

This logs all the details of each memcached instance configured to work with magma.

Returns:

This function returns no value.

Definition at line 207 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.92.1.6 bool_t cache_set_value (cache_keys_t * setting, cache_t * cache, stringer_t * value)

Set the value of a key for a specified cache server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the cache server key to be set.

cache a pointer to the cache server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 282 of file cache.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, cache_keys_t::name, cache_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), cache_keys_t::offset, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by cache_alloc(), and cache_config().

5.92.1.7 bool_t cache_validate (void)

Validate all of the configured magma cache server instances.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all cache servers have been validated, or false on failure.

Definition at line 93 of file cache.c.

References magma_t::cache, cache_keys, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, magma_t::iface, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_empty, multi_t::type, type(), multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

- [PUBLIC_FUNC_DECL](#) (void, destroy_cache_entry, [cached_object_t](#) *entry)
- [PUBLIC_FUNC_DECL](#) (void *, get_cache_obj_data, [cached_object_t](#) *object)
- [cached_object_t](#) * [_create_cached_object](#) ([cached_data_type_t](#) dtype, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)

Allocate and initialize a new cached object.

- [cached_store_t](#) * [_get_cached_store_by_type](#) ([cached_data_type_t](#) dtype)

Get a pointer to a cached object store by its type.

- void [_dump_cache](#) ([cached_data_type_t](#) dtype, int do_data, int ephemeral)

Dump the content of the specified data cached store(s) to the console.

- void [_dump_cache_data](#) (FILE *fp, const [cached_object_t](#) *obj, int brief)

Dump information about a specified cached object to a file stream.

- [cached_object_t](#) * [_clone_cached_object](#) (const [cached_object_t](#) *obj)

Clone a deep copy of a cached object for user-safe retrieval.

- size_t [_mem_append_serialized](#) (unsigned char **buf, size_t *blen, const unsigned char *data, size_t dlen)

Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

- size_t [_mem_append_serialized_string](#) (unsigned char **buf, size_t *blen, const char *string)

Append a null-terminated string to a dynamically allocated buffer for serialization.

- size_t [_mem_append_serialized_array](#) (unsigned char **buf, size_t *blen, const unsigned char **array, size_t itemsz)

Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

- size_t [_mem_append_serialized_str_array](#) (unsigned char **buf, size_t *blen, const char **array)

Append an array of null-terminated strings to a dynamically allocated buffer for serialization.

- size_t [_mem_append_serialized_array_cb](#) (unsigned char **buf, size_t *blen, const char **array, [custom_serializer_t](#) sf)

Append an array of custom-formatted data to a dynamically allocated buffer for serialization.

- unsigned int [_deserialize_data](#) (unsigned char *dst, unsigned char **bufptr, const unsigned char *bufend, size_t len)

Deserialize a fixed-sized chunk of data from an input buffer.

- unsigned char * [_deserialize_vardata](#) (unsigned char **bufptr, const unsigned char *bufend, size_t *outlen)
Deserialize a variable-length chunk of data from an input buffer.
- unsigned int [_deserialize_string](#) (char **dst, unsigned char **bufptr, const unsigned char *bufend)
Deserialize a null-terminated string from an input buffer.
- unsigned int [_deserialize_array](#) (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, size_t itemsize)
Deserialize an array of fixed-size objects from an input buffer.
- unsigned int [_deserialize_str_array](#) (char ***dst, unsigned char **bufptr, const unsigned char *bufend)
Deserialize an array of null-terminated string from an input buffer.
- unsigned int [_deserialize_array_cb](#) (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, [custom_deserializer_t](#) dfn)
Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.
- int [_is_object_expired](#) ([cached_object_t](#) *obj, int *refresh)
Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.
- [cached_object_t](#) * [_unlink_object](#) ([cached_object_t](#) *object, int destroy, int stale)
Unlink a cached object from its doubly linked list.
- [cached_object_t](#) * [_replace_object](#) ([cached_object_t](#) *oobj, [cached_object_t](#) *nobj, int shadow)
Replace one object in the cache with another.
- unsigned int [_evict_if_stale](#) ([cached_object_t](#) **objptr)
Evict an item from the object cache if it is stale (has expired).
- void [_lock_cache_store](#) ([cached_store_t](#) *store)
Lock a cached store for thread-safe processing.
- void [_unlock_cache_store](#) ([cached_store_t](#) *store)
Unlock a cached store for use by other callers.
- void * [_deserialize_signet_cb](#) (void *data, size_t len)
Deserializes signet from a void pointer.
- void * [_serialize_signet_cb](#) (void *record, size_t *outlen)
Serializes a [signet_t](#) structure into a binary string.
- void [_destroy_signet_cb](#) (void *record)
Destroys a [signet_t](#) structure.
- void [_dump_signet_cb](#) (FILE *fp, void *record, int brief)
Dumps a signet from a [signet_t](#) structure.

5.93.1 Define Documentation

5.93.1.1 `#define CACHE_PERM_ADD 0x8`

Definition at line 17 of file cache.h.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_add_cached_object_cmp_forced()`, and `_add_cached_object_forced()`.

5.93.1.2 `#define CACHE_PERM_ALL_FLAGS (CACHE_PERM_LOAD | CACHE_PERM_SAVE | CACHE_PERM_READ | CACHE_PERM_ADD | CACHE_PERM_DELETE)`

Definition at line 21 of file cache.h.

Referenced by `_set_cache_permissions()`.

5.93.1.3 `#define CACHE_PERM_DEFAULT CACHE_PERM_ALL_FLAGS`

Definition at line 22 of file cache.h.

5.93.1.4 `#define CACHE_PERM_DELETE 0x16`

Definition at line 18 of file cache.h.

Referenced by `_remove_cached_object()`, and `_remove_cached_object_cmp()`.

5.93.1.5 `#define CACHE_PERM_LOAD 0x1`

Definition at line 14 of file cache.h.

Referenced by `_load_cache_contents()`, and `_save_cache_contents()`.

5.93.1.6 `#define CACHE_PERM_NONE 0`

Definition at line 20 of file cache.h.

5.93.1.7 `#define CACHE_PERM_READ 0x4`

Definition at line 16 of file cache.h.

Referenced by `_cached_object_exists()`, `_cached_object_exists_cmp()`, `_find_cached_object()`, and `_find_cached_object_cmp()`.

5.93.1.8 `#define CACHE_PERM_SAVE 0x2`

Definition at line 15 of file cache.h.

5.93.2 Typedef Documentation

5.93.2.1 `typedef struct cached_object cached_object_t`

5.93.2.2 `typedef int(* cached_store_comparator_t)(const void *, const void *)`

Definition at line 67 of file cache.h.

5.93.2.3 `typedef unsigned int(* custom_deserializer_t)(unsigned char **, unsigned char **, const unsigned char *)`

Definition at line 68 of file `cache.h`.

5.93.2.4 `typedef void(* custom_dumper_t)(FILE *, void *, int)`

Definition at line 71 of file `cache.h`.

5.93.2.5 `typedef size_t(* custom_serializer_t)(unsigned char **, size_t *, const void *)`

Definition at line 69 of file `cache.h`.

5.93.3 Enumeration Type Documentation

5.93.3.1 `enum cached_data_type_t`

Enumerator:

cached_data_unknown
cached_data_drec
cached_data_dnskey
cached_data_ds
cached_data_ocsp
cached_data_signet

Definition at line 25 of file `cache.h`.

5.93.4 Function Documentation

5.93.4.1 `cached_object_t* _clone_cached_object (const cached_object_t * obj)`

Clone a deep copy of a cached object for user-safe retrieval.

Definition at line 994 of file `cache.c`.

References `_get_cached_store_by_type()`, `cached_store_t::clone`, `cached_object::data`, `data`, `cached_store_t::deserialize`, `cached_object::dtype`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `cached_object::expiration`, `cached_object::id`, `cached_store_t::internal`, `cached_object::persists`, `PUSH_ERROR_SYSCALL`, `cached_object::relaxed`, `RET_ERROR_PTR`, `cached_store_t::serialize`, `store`, `cached_object::timestamp`, and `cached_object::ttl`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_find_cached_object()`, and `_find_cached_object_cmp()`.

5.93.4.2 `cached_object_t* _create_cached_object (cached_data_type_t dtype, unsigned long ttl, time_t expiration, void * data, int persists, int relaxed)`

Allocate and initialize a new cached object.

See also:

[_add_cached_object\(\)](#)

Note:

The `data` parameter specifies an object-specific value that will be passed to other parts of the cache management subsystem, such as functions for deletion, destruction, search, etc.

Parameters:

dtype the data type identifying the cached store to which this cached object will belong.

ttl if not 0, an optional time-to-live value in seconds specifying in how many seconds from now the cached object will reach expiration.

expiration if not 0, an optional UTC time value specifying the exact time at which this cached object will reach expiration.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy. A relaxed cache policy ensures that even if the entry's ttl has expired, if its absolute (UTC) expiration time has not been reached, it will not be evicted from the cache, but will allow for a notification to the caller that it is time for the cached entry to be refreshed.

Returns:

a pointer to a newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 244 of file cache.c.

References `cached_object::data`, `cached_object::dtype`, `ERR_NOMEM`, `ERR_UNSPEC`, `cached_object::expiration`, `cached_object::persists`, `PUSH_ERROR_SYSCALL`, `cached_object::relaxed`, `RET_ERROR_PTR`, `cached_object::timestamp`, and `cached_object::ttl`.

Referenced by `_add_cached_object_cmp()`, `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, and `_get_dime_record()`.

5.93.4.3 `unsigned int _deserialize_array (unsigned char *** dst, unsigned char ** bufptr, const unsigned char * bufend, size_t itemsz)`

Deserialize an array of fixed-size objects from an input buffer.

Note:

This is the inverse function of [_mem_append_serialized_array\(\)](#).

Parameters:

dst a pointer to the address of an array of objects that will receive a copy of the deserialized data as an array of (NULL pointer terminated) fixed-size objects on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

itemsz the size, in bytes, of the fixed-sized objects to be deserialized.

Returns:

1 on success or 0 on failure.

Definition at line 1876 of file cache.c.

References `_deserialize_data()`, `_ptr_chain_add()`, `_ptr_chain_free()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, and `RET_ERROR_UINT`.

Referenced by `_deserialize_dime_record_cb()`.

5.93.4.4 `unsigned int _deserialize_array_cb (unsigned char *** dst, unsigned char ** bufptr, const unsigned char * bufend, custom_deserializer_t dfn)`

Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.

Note:

This is the inverse function of [_mem_append_serialized_array_cb\(\)](#).

Parameters:

- dst* a pointer to the address of an array of data buffers that will receive a copy of the deserialized data as an array of (NULL pointer terminated) data buffers on success.
- bufptr* a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.
- bufend* a pointer to the end of the input buffer for validation purposes.
- dfn* a custom deserialization function that will be used to deserialize the user data from the input buffer.

Returns:

- 1 on success or 0 on failure.

Definition at line 2025 of file cache.c.

References `_deserialize_data()`, `_ptr_chain_add()`, `_ptr_chain_free()`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, and `RET_ERROR_UINT`.

5.93.4.5 `unsigned int _deserialize_data (unsigned char * dst, unsigned char ** bufptr, const unsigned char * bufend, size_t len)`

Deserialize a fixed-sized chunk of data from an input buffer.

Note:

- This is the inverse function of `_mem_append()`; *dst* must be at least *len* bytes long.

Parameters:

- dst* a pointer to the output buffer that will receive the deserialized data.
- bufptr* a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.
- bufend* a pointer to the end of the input buffer for validation purposes.
- len* the size of the data chunk to be deserialized from the input buffer.

Returns:

- 1 on success or 0 on failure.

Definition at line 1755 of file cache.c.

References `ERR_BAD_PARAM`, `ERR_UNSPEC`, `RET_ERROR_UINT`, and `RET_ERROR_UINT_FMT`.

Referenced by `_deserialize_array()`, `_deserialize_array_cb()`, `_deserialize_dime_record_cb()`, `_deserialize_dnskey_record_cb()`, `_deserialize_ds_record_cb()`, `_deserialize_str_array()`, and `_deserialize_vardata()`.

5.93.4.6 `void* _deserialize_signet_cb (void * data, size_t len)`

Deserializes signet from a void pointer.

Parameters:

- data* Pointer to serial signet data.
- len* Length of serial signet data.

Returns:

- Void pointer to a `signet_t` structure.

Definition at line 2321 of file cache.c.

References `dime_sgmt_signet_binary_deserialize()`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, and `RET_ERROR_PTR`.

5.93.4.7 unsigned int _deserialize_str_array (char * *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)**

Deserialize an array of null-terminated string from an input buffer.

Note:

This is the inverse function of [_mem_append_serialized_str_array\(\)](#).

Parameters:

dst a pointer to the address of an array of strings that will receive a copy of the deserialized data as an array of (NULL pointer terminated) null-terminated strings on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1955 of file cache.c.

References [_deserialize_data\(\)](#), [_deserialize_string\(\)](#), [_ptr_chain_add\(\)](#), [_ptr_chain_free\(\)](#), [ERR_BAD_PARAM](#), [ERR_UNSPEC](#), and [RET_ERROR_UINT](#).

Referenced by [_deserialize_dime_record_cb\(\)](#).

5.93.4.8 unsigned int _deserialize_string (char ** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)

Deserialize a null-terminated string from an input buffer.

Note:

This is the inverse function of [_mem_append_serialized_string\(\)](#).

Parameters:

dst a pointer to the address of a string that will receive a copy of the deserialized data as a null-terminated string on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1826 of file cache.c.

References [ERR_BAD_PARAM](#), [ERR_UNSPEC](#), [PUSH_ERROR_SYSCALL](#), and [RET_ERROR_UINT](#).

Referenced by [_deserialize_dime_record_cb\(\)](#), [_deserialize_dnskey_record_cb\(\)](#), [_deserialize_ds_record_cb\(\)](#), and [_deserialize_str_array\(\)](#).

5.93.4.9 unsigned char* _deserialize_vardata (unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t * *olen*)

Deserialize a variable-length chunk of data from an input buffer.

Note:

This is the inverse function of [_mem_append_serialized](#).

Parameters:

- bufptr* a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.
- bufend* a pointer to the end of the input buffer for validation purposes.
- olen* an optional pointer to receive the size of the deserialized data on success.

Returns:

a pointer to a newly allocated buffer containing the deserialized data on success, or NULL on failure.

Definition at line 1784 of file cache.c.

References `_deserialize_data()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_PTR`, and `RET_ERROR_UINT`.

Referenced by `_deserialize_dnskey_record_cb()`, and `_deserialize_ds_record_cb()`.

5.93.4.10 void _destroy_signet_cb (void *record)

Destroys a `signet_t` structure.

Parameters:

- record* Void pointer to a `signet_t` structure to be destroyed.

Definition at line 2399 of file cache.c.

References `dime_sgmt_signet_destroy()`.

5.93.4.11 void _dump_cache (cached_data_type_t dtype, int do_data, int ephemeral)

Dump the content of the specified data cached store(s) to the console.

Parameters:

- dtype* the type of the object cached store to be dumped, or `cached_data_unknown` for all stores.
- do_data* if non-zero, dump the type-specific data associated with the cached object.
- ephemeral* if non-zero, print out ephemeral as well as persistent cache data.

Definition at line 1068 of file cache.c.

References `_dump_cache_data()`, `_get_chr_date()`, `_lock_cache_store()`, `_unlock_cache_store()`, `cached_data_unknown`, `cached_object::data`, `cached_store_t::dtype`, `cached_object::expiration`, `cached_object::next`, `cached_object::persists`, `cached_object::relaxed`, `cached_object::shadow`, `cached_object::timestamp`, and `cached_object::ttl`.

5.93.4.12 void _dump_cache_data (FILE *fp, const cached_object_t *obj, int brief)

Dump information about a specified cached object to a file stream.

Parameters:

- fp* a pointer to the file stream across which the data should be dumped.
- obj* a pointer to the cached object to have its details dumped.
- brief* if true, print a brief one-line description of the object; otherwise, dump full object information.

Definition at line 1163 of file cache.c.

References `_clear_error_stack()`, `_get_cached_store_by_type()`, `cached_object::data`, `cached_object::dtype`, `cached_store_t::dump`, `dump_error_stack()`, `get_last_error()`, and `store`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, `_dump_cache()`, `_load_cache_contents()`, and `_unlink_object()`.

5.93.4.13 `void _dump_signet_cb (FILE *fp, void *record, int brief)`

Dumps a signet from a `signet_t` structure.

Parameters:

fp File descriptor that specifies the output destination.

record Void pointer to a `signet_t` structure.

brief TODO

Definition at line 2377 of file cache.c.

References `dime_sgmt_signet_dump()`.

5.93.4.14 `unsigned int _evict_if_stale (cached_object_t **objptr)`

Evict an item from the object cache if it is stale (has expired).

Returns:

1 if the object was evicted for being stale or 0 if it was not.

Definition at line 2287 of file cache.c.

References `_clear_error_stack()`, `_is_object_expired()`, `_unlink_object()`, `dump_error_stack()`, and `get_last_error()`.

Referenced by `_add_cached_object()`, `_add_cached_object_cmp()`, `_cached_object_exists()`, `_cached_object_exists_cmp()`, `_find_cached_object()`, `_find_cached_object_cmp()`, `_remove_cached_object()`, and `_remove_cached_object_cmp()`.

5.93.4.15 `cached_store_t* _get_cached_store_by_type (cached_data_type_t dtype)`

Get a pointer to a cached object store by its type.

Parameters:

dtype the numerical identifier of the cached data type.

Returns:

a pointer to the requested cached object store on success, or NULL on failure.

Definition at line 46 of file cache.c.

Referenced by `_clone_cached_object()`, `_destroy_cache_entry()`, `_dump_cache_data()`, `_get_cache_obj_data()`, `_load_cache_contents()`, `_replace_object()`, and `_unlink_object()`.

5.93.4.16 `int _is_object_expired (cached_object_t *obj, int *refresh)`

Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.

Note:

An object has "expired" and needs to be evicted from the cache if it has a non-zero TTL from its cache date that has been reached, or a non-zero absolute expiration date that has been exceeded. If the object's cache policy is relaxed, a TTL expiration advises a "refresh" if no absolute expiration has occurred.

Parameters:

obj a pointer to the cached object to have its age examined.

refresh an optional pointer to a value that, if the cached object has a relaxed expiration policy, will be set to 1 if it needs to be refreshed or 0 if it does not.

Returns:

1 if the object has expired or 0 if it has not; -1 if a general error has occurred.

Definition at line 2093 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, cached_object::expiration, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_INT, cached_object::timestamp, and cached_object::ttl.

Referenced by _evict_if_stale(), and _get_dime_record().

5.93.4.17 void _lock_cache_store (cached_store_t * store)

Lock a cached store for thread-safe processing.

Parameters:

store a pointer to the cached store to be locked.

Definition at line 2261 of file cache.c.

References cached_store_t::lock.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), and _save_cache_contents().

5.93.4.18 size_t _mem_append_serialized (unsigned char ** buf, size_t * blen, const unsigned char * data, size_t dlen)

Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

data a pointer to a buffer holding the data that will be appended to the end of the output buffer.

dlen the size, in bytes, of the data buffer to be appended to the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1524 of file cache.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _mem_append_serialized_array(), _mem_append_serialized_array_cb(), _mem_append_serialized_str_array(), _serialize_dnskey_record_cb(), and _serialize_ds_record_cb().

5.93.4.19 size_t _mem_append_serialized_array (unsigned char ** *buf*, size_t * *blen*, const unsigned char ** *array*, size_t *itemsz*)

Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

Parameters:

- buf* a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
- blen* a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
- array* an array of pointers to fixed-size objects (ending with a NULL pointer) to be appended to the end of the output buffer.
- itemsz* the size, in bytes, of the array elements to be deserialized.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1585 of file cache.c.

References `_mem_append()`, `_mem_append_serialized()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_serialize_dime_record_cb()`.

5.93.4.20 size_t _mem_append_serialized_array_cb (unsigned char ** *buf*, size_t * *blen*, const char ** *array*, custom_serializer_t *sfn*)

Append an array of custom-formatted data to a dynamically allocated buffer for serialization.

Note:

This function uses a custom serialization function in order to output the user data properly.

Parameters:

- buf* a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
- blen* a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
- array* an array of pointers to custom-formatted data buffers (ending with a NULL pointer) to be appended to the end of the output buffer using a custom serialization function.
- sfn* a custom serialization function that will be used to serialize the user data into the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1698 of file cache.c.

References `_mem_append()`, `_mem_append_serialized()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

5.93.4.21 size_t _mem_append_serialized_str_array (unsigned char ** *buf*, size_t * *blen*, const char ** *array*)

Append an array of null-terminated strings to a dynamically allocated buffer for serialization.

Parameters:

- buf* a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
- blen* a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
- array* an array of pointers to null-terminated strings (ending with a NULL pointer) to be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1640 of file cache.c.

References `_mem_append()`, `_mem_append_serialized()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_serialize_dime_record_cb()`.

5.93.4.22 `size_t _mem_append_serialized_string (unsigned char ** buf, size_t * blen, const char * string)`

Appended a null-terminated string to a dynamically allocated buffer for serialization.

Parameters:

- buf* a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.
- blen* a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.
- string* a null-terminated string that will be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1552 of file cache.c.

References `_mem_append()`, `ERR_BAD_PARAM`, `ERR_NOMEM`, and `RET_ERROR_UINT`.

Referenced by `_serialize_dime_record_cb()`, `_serialize_dnskey_record_cb()`, and `_serialize_ds_record_cb()`.

5.93.4.23 `cached_object_t* _replace_object (cached_object_t * oobj, cached_object_t * nobj, int shadow)`

Replace one object in the cache with another.

Note:

If shadow is not set, then the old cached object will be automatically destroyed. Otherwise this function also makes the old cached object the new cached object's "shadow" data.

Parameters:

- oobj* a pointer to the old cached object to be replaced in its cached store with the new object.
- nobj* a pointer to the new cached object that will replace the old object in the cached store.
- shadow* if set, preserve the old object as the "shadow" value of the new object.

Returns:

NULL on failure, or a pointer to the new cached object on success.

Definition at line 2208 of file cache.c.

References `_destroy_cache_entry()`, `_get_cached_store_by_type()`, `cached_object::dtype`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `cached_store_t::head`, `cached_object::id`, `cached_object::next`, `cached_object::prev`, `RET_ERROR_PTR`, `SHA_256_SIZE`, `cached_object::shadow`, and `store`.

Referenced by `_add_cached_object_cmp_forced()`, `_add_cached_object_forced()`, and `_get_dime_record()`.

5.93.4.24 `void* _serialize_signet_cb (void * record, size_t * outlen)`

Serializes a [signet_t](#) structure into a binary string.

Parameters:

- record* Void pointer to a [signet_t](#) structure to be serialized.

outlen Pointer to the length of the returned string.

Returns:

Pointer to a serialized signet.

Definition at line 2343 of file cache.c.

References dime_sgmt_signet_binary_serialize(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.93.4.25 cached_object_t* _unlink_object (cached_object_t * object, int destroy, int stale)

Unlink a cached object from its doubly linked list.

Parameters:

object a pointer to the cached object to be delinked.

destroy if set, deallocate the specified cached object after unlinking.

stale if set, the cache removal was performed because of a stale entry.

Returns:

a pointer to the next cached object in the store, or NULL if at the end of the store.

Definition at line 2140 of file cache.c.

References _clear_error_stack(), _dbgprint(), _dump_cache_data(), _get_cached_store_by_type(), _verbose, cached_object::data, cached_store_t::destructor, cached_object::dtype, cached_store_t::dump, dump_error_stack(), ERR_BAD_PARAM, ERR_UNSPEC, get_last_error(), cached_store_t::head, cached_object::next, cached_object::prev, RET_ERROR_PTR, and store.

Referenced by _do_ocsp_validation(), _evict_if_stale(), _remove_cached_object(), and _remove_cached_object_cmp().

5.93.4.26 void _unlock_cache_store (cached_store_t * store)

Unlock a cached storea for use by other callers.

Parameters:

store a pointer to the cached store to be unlocked.

Definition at line 2274 of file cache.c.

References cached_store_t::lock.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), and _save_cache_contents().

Definition at line 6 of file keys.h.

5.98.2 Function Documentation

5.98.2.1 [EC_KEY](#)* [dime_keys_enckey_fetch](#) (char const * *filename*)

Retrieves the signing key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the ed25519 signing key. {free_ed25519_key}

Definition at line 633 of file keys.c.

References [PUBLIC_FUNCTION_IMPLEMENT](#).

5.98.2.2 int dime_keys_file_create (keys_type_t type, ED25519_KEY * sign_key, EC_KEY * enc_key, const char * filename)

Creates a keys file with specified signing and encryption keys.

Parameters:

type Type of keys file, whether the keys correspond to a user or organizational signet.

sign_key Pointer to the specified ed25519 key, the private portion of which will be stored in the keys file as the signing key.

enc_key Pointer to the specified elliptic curve key, the private portion of which will be stored in the keys file as the encryption key.

filename Pointer to the NULL terminated string containing the filename for the keys file.

Returns:

0 on success, -1 on failure.

Definition at line 586 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.98.2.3 int dime_keys_generate (keys_type_t type, char ** signet_pem, char ** key_pem)

Definition at line 637 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.98.2.4 ED25519_KEY* dime_keys_signkey_fetch (char const * filename)

Retrieves the encryption key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the elliptic curve encryption key. {free_ec_key}

Definition at line 620 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Enumerations

- enum { [USER_CONF_STATUS_NONE](#) = 0, [USER_CONF_STATUS_CRITICAL](#) = 1 }

Functions

- struct [__attribute__](#) ((packed))
- [user_config_t](#) * [user_config_alloc](#) (uint64_t usernum)
config.c
- [user_config_t](#) * [user_config_create](#) (uint64_t usernum)
Create a new user config collection object for the specified user and populate it with config entries from the database.
- int_t [user_config_edit](#) ([user_config_t](#) *collection, [stringer_t](#) *key, [stringer_t](#) *value)
Change the value of, or delete a key from a user's config collection.
- [user_config_entry_t](#) * [user_config_entry_alloc](#) ([stringer_t](#) *key, [stringer_t](#) *value, uint64_t flags)
Create and initialize new user config entry object.
- void [user_config_entry_free](#) ([user_config_entry_t](#) *entry)
Destroy a user config entry.
- void [user_config_free](#) ([user_config_t](#) *collection)
Free a user config collection object.
- int_t [user_config_update](#) ([user_config_t](#) *collection)
Update a collection of user config options from the database, if necessary.
- int_t [user_config_delete](#) (uint64_t usernum, [stringer_t](#) *key)
datatier.c
- bool_t [user_config_fetch](#) ([user_config_t](#) *collection)
Fetch a user's config collection from the database.
- int_t [user_config_upsert](#) (uint64_t usernum, [stringer_t](#) *key, [stringer_t](#) *value, uint64_t flags)
Update a user config entry in the database, or insert it if it does not already exist.

Variables

- [user_config_entry_t](#)
- [user_config_t](#)

5.101.1 Enumeration Type Documentation

5.101.1.1 anonymous enum

Enumerator:

[USER_CONF_STATUS_NONE](#)

USER_CONF_STATUS_CRITICAL

Definition at line 17 of file config.h.

5.101.2 Function Documentation**5.101.2.1 struct __attribute__((packed)) [read]**

Definition at line 22 of file config.h.

References `inx_t`, and `__attribute__::usernum`.

5.101.2.2 user_config_t* user_config_alloc (uint64_t usernum)

config.c config.c

Parameters:

usernum the numerical user id for the requested user.

Returns:

NULL on failure or a pointer to the newly allocated user config collection object on success.

Definition at line 44 of file config.c.

References `align()`, `inx_alloc()`, `log_pedantic`, `M_INX_TREE`, `mm_alloc()`, `mm_free()`, `user_config_entry_free()`, and `user_config_t`.

Referenced by `user_config_create()`.

5.101.2.3 user_config_t* user_config_create (uint64_t usernum)

Create a new user config collection object for the specified user and populate it with config entries from the database.

Parameters:

usernum the numerical user id for the user to be queried.

Returns:

NULL on failure, or a pointer to the newly created user config collection object on success.

Definition at line 106 of file config.c.

References `log_pedantic`, `OBJECT_CONFIG`, `serial_get()`, `user_config_alloc()`, `user_config_fetch()`, `user_config_free()`, and `user_config_t`.

Referenced by `portal_endpoint_config_edit()`, and `portal_endpoint_config_load()`.

5.101.2.4 int_t user_config_delete (uint64_t usernum, stringer_t * key)

datatier.c datatier.c

Parameters:

usernum the numerical userid of the user to whom the requested config key belongs.

key a managed string containing the name of the config key to be deleted.

Returns:

1 if the config option was successfully deleted, 0 if the config key couldn't be found in the database, or -1 on general failure.

Definition at line 16 of file `datatier.c`.

References `log_check`, `log_pedantic`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `st_length_int()`, and `stmt_exec_affected()`.

Referenced by `user_config_edit()`.

5.101.2.5 int_t user_config_edit (user_config_t * collection, stringer_t * key, stringer_t * value)

Change the value of, or delete a key from a user's config collection.

Parameters:

collection a pointer to a collection of user's config entries.

key a pointer to a managed string containing the name of the user config key to be modified.

value a pointer to a managed string containing the name of the new value of the key, or NULL if it is to be deleted.

Returns:

-1 on error or 1 on success.

Definition at line 160 of file `config.c`.

References `inx_delete()`, `inx_find()`, `inx_replace()`, `log_pedantic`, `M_TYPE_STRINGER`, `OBJECT_CONFIG`, `serial_increment()`, `multi_t::st`, `st_cmp_cs_eq()`, `st_empty`, `user_config_delete()`, `user_config_entry_alloc()`, `user_config_entry_free()`, `user_config_entry_t`, `user_config_upsert()`, and `multi_t::val`.

Referenced by `portal_endpoint_config_edit()`.

5.101.2.6 user_config_entry_t* user_config_entry_alloc (stringer_t * key, stringer_t * value, uint64_t flags)

Create and initialize new user config entry object.

Parameters:

key a managed string containing the key of the config entry object.

value a managed string containing the value of the config entry object.

flags a bitmask reflecting the flags of the config entry object.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized user config entry object on success.

Definition at line 70 of file `config.c`.

References `align()`, `FOREIGNDATA`, `JOINTED`, `log_pedantic`, `mm_alloc()`, `mm_copy()`, `PLACER_T`, `placer_t`, `st_data_get()`, `st_length_get()`, `STACK`, and `user_config_entry_t`.

Referenced by `user_config_edit()`, and `user_config_fetch()`.

5.101.2.7 void user_config_entry_free (user_config_entry_t * entry)

Destroy a user config entry.

Parameters:

entry a pointer to the user config entry object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file config.c.

References mm_free().

Referenced by user_config_alloc(), user_config_edit(), and user_config_fetch().

5.101.2.8 bool_t user_config_fetch (user_config_t * collection)

Fetch a user's config collection from the database.

Parameters:

collection a pointer to the specified user config collection object (with usernum field set by the caller) to be populated from the database.

Returns:

true on success or false on failure.

Definition at line 96 of file datatier.c.

References inx_insert(), log_info, log_pedantic, M_TYPE_STRINGER, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), multi_t::st, stmt_get_result(), user_config_entry_alloc(), user_config_entry_free(), user_config_entry_t, and multi_t::val.

Referenced by user_config_create(), and user_config_update().

5.101.2.9 void user_config_free (user_config_t * collection)

Free a user config collection object.

Parameters:

collection a pointer to the user config collection object to be freed.

Returns:

This function returns no value.

Definition at line 29 of file config.c.

References inx_cleanup(), and mm_free().

Referenced by portal_endpoint_config_edit(), portal_endpoint_config_load(), and user_config_create().

5.101.2.10 int_t user_config_update (user_config_t * collection)

Update a collection of user config options from the database, if necessary.

Note:

This function is not currently being used anywhere. If this function returns -1, the config entries are left in an undefined state and should not be relied upon.

Parameters:

collection a pointer to a collection of user config entries to be checked for updates.

Returns:

1 if the collection is up-to-date, 0 if it was refreshed to update changes, or -1 if the refresh operation failed.

Definition at line 132 of file config.c.

References `inx_truncate()`, `OBJECT_CONFIG`, `serial_get()`, and `user_config_fetch()`.

5.101.2.11 int_t user_config_upsert (uint64_t usernum, stringer_t * key, stringer_t * value, uint64_t flags)

Update a user config entry in the database, or insert it if it does not already exist.

Parameters:

usernum the numerical id of the user to whom the specified config entry belongs.

key a pointer to a managed string containing the name of the config entry to be updated or inserted.

value a pointer to a managed string containing the value of the specified config entry key.

flags a bitmask of flags for the config entry (`USER_CONF_STATUS_CRITICAL` is supported).

Returns:

2 if the config entry was updated, 1 if a new config key was inserted into the database, 0 if no update was necessary, or -1 on general failure.

Definition at line 52 of file datatier.c.

References `log_check`, `log_pedantic`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `st_length_int()`, and `stmt_exec_affected()`.

Referenced by `user_config_edit()`.

5.101.3 Variable Documentation**5.101.3.1 user_config_entry_t**

Definition at line 14 of file config.h.

Referenced by `portal_config_collection()`, `user_config_edit()`, `user_config_entry_alloc()`, and `user_config_fetch()`.

5.101.3.2 user_config_t

Definition at line 25 of file config.h.

Referenced by `portal_endpoint_config_edit()`, `portal_endpoint_config_load()`, `user_config_alloc()`, and `user_config_create()`.

#include "magma.h"
```

Functions

- `uint64_t config_fetch_host_number (void)`
Retrieve this computer's host number from the database.
- `table_t * config_fetch_settings (void)`
Retrieve the entire collection of configuration key/value pairs from the database.

5.102.1 Function Documentation

5.102.1.1 `uint64_t config_fetch_host_number (void)`

Retrieve this computer's host number from the database. `datatier.c`

Returns:

this host's numerical identifier, or 0 on failure.

Definition at line 14 of file `datatier.c`.

References `magma_t::host`, `log_error`, `magma`, `mm_wipe()`, `magma_t::name`, `ns_length_get()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, and `stmt_get_result()`.

Referenced by `config_load_database_settings()`.

5.102.1.2 `table_t* config_fetch_settings (void)`

Retrieve the entire collection of configuration key/value pairs from the database.

Parameters:

none This function accepts no parameters.

Returns:

NULL on failure, or a database table of configuration key/value pairs on success.

Definition at line 40 of file `datatier.c`.

References `magma_t::host`, `magma`, `mm_wipe()`, `magma_t::name`, `ns_length_get()`, and `stmt_get_result()`.

Referenced by `config_load_database_settings()`.

5.103 src/objects/auth/datatier.c File Reference

```
#include "magma.h"
```

Functions

- `int_t auth_data_update_legacy` (uint64_t usernum, `stringer_t` *legacy, `stringer_t` *salt, `stringer_t` *verification, uint32_t bonus)
Replaces legacy auth tokens with STACIE compatible tokens.
- `void auth_data_update_lock` (uint64_t usernum, `auth_lock_status_t` lock)
Update a user lock status in the database.
- `int_t auth_data_fetch` (`auth_t` *auth)
Fetches the authentication information based on the provided username.

5.103.1 Function Documentation

5.103.1.1 int_t auth_data_fetch (auth_t * auth)

Fetches the authentication information based on the provided username. datatier.c

Note:

This function searches the Users table first, and the Mailboxes table second. This way if someone sneaks a username into the Mailboxes table, they won't override the Users table.

Parameters:

auth The authentication object providing the username, and used to store the result.

Returns:

0 if the user information is pulled correctly, 1 if the user isn't found, and -1 if an error occurs.

Definition at line 134 of file datatier.c.

References `base64_decode_mod()`, `auth_t::bonus`, `hex_decode_st()`, `auth_t::legacy`, `auth_t::locked`, `log_error`, `log_pedantic`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_int8()`, `res_field_length()`, `res_field_string()`, `res_field_uint32()`, `res_field_uint64()`, `res_row_count()`, `res_row_next()`, `res_table_free()`, `auth_t::salt`, `auth_t::seasoning`, `st_char_get()`, `st_cmp_cs_eq()`, `st_empty`, `st_free()`, `st_length_get()`, `st_length_int()`, `st_search_chr()`, `STACIE_KEY_ROUNDS_MAX`, `STACIE_SALT_LENGTH`, `STACIE_TOKEN_LENGTH`, `auth_t::status`, `stmt_get_result()`, `auth_t::token`, `auth_t::tokens`, `auth_t::username`, `auth_t::usernum`, and `auth_t::verification`.

Referenced by `auth_challenge()`.

5.103.1.2 int_t auth_data_update_legacy (uint64_t usernum, stringer_t * legacy, stringer_t * salt, stringer_t * verification, uint32_t bonus)

Replaces legacy auth tokens with STACIE compatible tokens.

Parameters:

usernum The user account number.

legacy The legacy auth token, encoded as a hexadecimal string.

salt The user specific salt value, encoded as a hexadecimal string.

verification The STACIE verification token, encoded as a hexadecimal string.

bonus The number of bonus hash rounds.

Returns:

0 if the user information was updated correctly, or -1 if an error occurs.

Definition at line 22 of file `datatier.c`.

References `log_error`, `log_pedantic`, `mm_wipe()`, `st_char_get()`, `st_empty`, `st_length_get()`, `STACIE_KEY_ROUNDS_MAX`, and `stmt_exec_affected()`.

Referenced by `auth_login()`.

5.103.1.3 `void auth_data_update_lock (uint64_t usernum, auth_lock_status_t lock)`

Update a user lock status in the database.

Parameters:

usernum the numerical id of the user for whom the lock will be set.

lock the new value to which the specified user's lock will be set.

Returns:

This function returns no value.

Definition at line 89 of file `datatier.c`.

References `log_pedantic`, `mm_wipe()`, and `stmt_exec_affected()`.

Referenced by `auth_login()`.

```
#include "magma.h"
```

Functions

- [int_t user_config_delete](#) (uint64_t usernum, [stringer_t](#) *key)
Delete a user config entry from the database by key.
- [int_t user_config_upsert](#) (uint64_t usernum, [stringer_t](#) *key, [stringer_t](#) *value, uint64_t flags)
Update a user config entry in the database, or insert it if it does not already exist.
- [bool_t user_config_fetch](#) ([user_config_t](#) *collection)
Fetch a user's config collection from the database.

5.104.1 Function Documentation

5.104.1.1 int_t user_config_delete (uint64_t usernum, stringer_t * key)

Delete a user config entry from the database by key. datatier.c

Parameters:

usernum the numerical userid of the user to whom the requested config key belongs.
key a managed string containing the name of the config key to be deleted.

Returns:

1 if the config option was successfully deleted, 0 if the config key couldn't be found in the database, or -1 on general failure.

Definition at line 16 of file datatier.c.

5.104.1.3 `int_t user_config_upsert (uint64_t usernum, stringer_t * key, stringer_t * value, uint64_t flags)`

Update a user config entry in the database, or insert it if it does not already exist.

Parameters:

usernum the numerical id of the user to whom the specified config entry belongs.

key a pointer to a managed string containing the name of the config entry to be updated or inserted.

value a pointer to a managed string containing the value of the specified config entry key.

flags a bitmask of flags for the config entry (USER_CONF_STATUS_CRITICAL is supported).

Returns:

2 if the config entry was updated, 1 if a new config key was inserted into the database, 0 if no update was necessary, or -1 on general failure.

Definition at line 52 of file `datatier.c`.

References `log_check`, `log_pedantic`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `st_length_int()`, and `stmt_exec_affected()`.

```
#include "magma.h"
```

Functions

- [int_t contact_update_stamp](#) (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)
Touch the last updated time stamp of a contact entry in the database.
- [int_t contact_delete](#) (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)
Delete a user's contact entry and its associated details from the database.
- [int_t contact_update](#) (uint64_t contactnum, uint64_t usernum, uint64_t cur_folder, uint64_t target_folder, [stringer_t](#) *name)
Update a user contact entry in the database.
- uint64_t [contact_insert](#) (uint64_t usernum, uint64_t foldernum, [stringer_t](#) *name)
Insert a new contact entry into the database.
- [int_t contact_detail_delete](#) (uint64_t contactnum, [stringer_t](#) *key)
Delete the specified contact detail of a contact entry from the database.
- [int_t contact_detail_upsert](#) (uint64_t contactnum, [stringer_t](#) *key, [stringer_t](#) *value, uint64_t flags)
Update a specified contact detail in the database, or insert it if it does not exist.
- [int_t contact_details_fetch](#) ([contact_t](#) *contact)
Populate a contact entry with its details from the database.
- [int_t contacts_fetch](#) (uint64_t usernum, [contact_folder_t](#) *folder)
Retrieve all of a user's contact entries in a specified contacts folder from the database.

5.105.1 Function Documentation

5.105.1.1 int_t contact_delete (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)

Delete a user's contact entry and its associated details from the database. datatier.c

Parameters:

- contactnum** the numerical id of the contact entry to be deleted.
- usernum** the numerical id of the user to whom the specified contact entry belongs.
- foldernum** the numerical id of the parent contact folder containing the contact entry.

Returns:

- 1 if the specified contact was deleted successfully, 0 if no matching contact was found in the database, or -1 on general failure.

Definition at line 61 of file datatier.c.

References [log_check](#), [log_pedantic](#), [mm_wipe\(\)](#), and [stmt_exec_affected\(\)](#).

Referenced by [contact_remove\(\)](#), and [portal_endpoint_contacts_remove\(\)](#).

5.105.1.2 `int_t contact_detail_delete (uint64_t contactnum, stringer_t * key)`

Delete the specified contact detail of a contact entry from the database.

Parameters:

contactnum the numerical id of the contact entry to have the specified detail removed.

key a managed string containing the name of the contact detail to be removed from the entry.

Returns:

-1 on error, 0 if no matching detail was found in the database, or 1 if the delete operation was successful.

Definition at line 204 of file `datatier.c`.

References `log_check`, `log_pedantic`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `st_length_int()`, and `stmt_exec_affected()`.

Referenced by `contact_edit()`.

5.105.1.3 `int_t contact_detail_upsert (uint64_t contactnum, stringer_t * key, stringer_t * value, uint64_t flags)`

Update a specified contact detail in the database, or insert it if it does not exist.

Parameters:

contactnum the numerical id of the contact entry to be modified.

key a managed string containing the name of the contact detail to be updated.

value a managed string containing the new value of the specified contact detail.

flags a bitmask of flags to be associated with the specified contact entry detail.

Returns:

-1 on error, 0 if no update was necessary, 1 if a new contact detail was inserted into the database, or 2 if the specified contact detail was updated successfully.

Definition at line 241 of file `datatier.c`.

References `log_check`, `log_pedantic`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `st_length_int()`, and `stmt_exec_affected()`.

Referenced by `contact_edit()`.

5.105.1.4 `int_t contact_details_fetch (contact_t * contact)`

Populate a contact entry with its details from the database.

Parameters:

contact a pointer to the contact entry object that will be updated.

Returns:

-1 on failure or 1 on success.

Definition at line 285 of file `datatier.c`.

References `contact_detail_alloc()`, `contact_detail_free()`, `contact_detail_t`, `inx_insert()`, `log_info`, `log_pedantic`, `M_TYPE_STRINGER`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_length()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `multi_t::st`, `stmt_get_result()`, and `multi_t::val`.

Referenced by `contacts_fetch()`.

5.105.1.5 uint64_t contact_insert (uint64_t usernum, uint64_t foldernum, stringer_t * name)

Insert a new contact entry into the database.

Parameters:

- usernum* the numerical id of the user to whom the contact entry belongs.
- foldernum* the numerical id of the parent folder to contain the contact entry.
- name* a pointer to a managed string containing the name of the new contact entry.

Returns:

- 1 on failure, 0 if no item was inserted into the database, or the id of the newly inserted contact entry in the database on success.

Definition at line 172 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_insert().

Referenced by contact_create().

5.105.1.6 int_t contact_update (uint64_t contactnum, uint64_t usernum, uint64_t cur_folder, uint64_t target_folder, stringer_t * name)

Update a user contact entry in the database.

Parameters:

- contactnum* the numerical id of the contact entry to be modified.
- usernum* the numerical id of the user to whom the specified contact entry belongs.
- cur_folder* the numerical id of the parent contact containing the specified contact entry.
- target_folder* if not 0, sets the new parent contact folder to which the specified contact entry will belong.
- name* if not NULL, sets the new name of the specified contact entry.

Returns:

- 1 on error, 0 if the specified contact entry was not found in the database, or 1 if the contact entry was successfully updated.

Definition at line 106 of file datatier.c.

References ISNULL, log_check, log_pedantic, mm_wipe(), st_char_get(), st_empty, st_length_get(), and stmt_exec_affected().

Referenced by contact_edit(), and contact_move().

5.105.1.7 int_t contact_update_stamp (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)

Touch the last updated time stamp of a contact entry in the database.

Parameters:

- contactnum* the numerical id of the contact entry to have its time stamp updated.
- usernum* the numerical id of the user to whom the contact entry belongs.
- foldernum* the numerical id of the parent folder containing the contact entry.

Returns:

- 1 if the contact time stamp was updated successfully, 0 if the specified contact was not found, or -1 on general failure.

Definition at line 17 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by contact_edit().

5.105.1.8 `int_t contacts_fetch(uint64_t usernum, contact_folder_t *folder)`

Retrieve all of a user's contact entries in a specified contacts folder from the database.

Parameters:

usernum the numerical id of the user whose contacts will be retrieved.

folder a pointer to the contact folder which will have its contents listed.

Returns:

-1 on failure or 1 on success.

LOW: Should we bother with error checking?

Definition at line 339 of file `datatier.c`.

```

Functions

- `inx_t * magma_folder_fetch` (uint64_t usernum, uint_t type)
Fetch all of a user's folders of a specified type from the database.
- `uint64_t magma_folder_insert` (uint64_t usernum, stringer_t *name, uint64_t parent, uint32_t order, uint_t type)
Insert a new folder into the database.
- `bool_t magma_folder_delete` (uint64_t usernum, uint64_t foldernum, uint_t type)
Delete a folder from the database.
- `bool_t magma_folder_rename` (uint64_t usernum, uint64_t foldernum, uint_t type, stringer_t *rename)
Rename a folder in the database.

5.106.1 Function Documentation

5.106.1.1 bool_t magma_folder_delete (uint64_t usernum, uint64_t foldernum, uint_t type)

Delete a folder from the database. datatier.c

Parameters:

- usernum** the numerical id of the user requesting the folder removal.
- foldernum** the numerical id of the folder to be removed.
- type** the type of the folder to be deleted (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

true on success or false on failure.

Definition at line 136 of file datatier.c.

References `mm_wipe()`, and `stmt_exec_affected()`.

Referenced by `contact_folder_remove()`, and `message_folder_remove()`.

5.106.1.2 inx_t* magma_folder_fetch (uint64_t usernum, uint_t type)

Fetch all of a user's folders of a specified type from the database.

Parameters:

- usernum** the numerical id of the requested user.
- type** the folder class of the folders to be retrieved (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

NULL on failure, or an inx object holding all of the requested folders on success.

Definition at line 16 of file `datatier.c`.

References `inx_alloc()`, `inx_free()`, `inx_insert()`, `inx_t`, `log_info`, `log_pedantic`, `M_INX_TREE`, `M_TYPE_UINT64`, `magma_folder_funcs()`, `magma_folder_t`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_length()`, `res_field_uint32()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `stmt_get_result()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `contacts_update()`, and `messages_update()`.

5.106.1.3 `uint64_t magma_folder_insert(uint64_t usernum, stringer_t * name, uint64_t parent, uint32_t order, uint_t type)`

Insert a new folder into the database.

Parameters:

usernum the numerical id of the user to whom the new folder belongs.

name a managed string containing the name of the new folder.

parent the numerical id of the mail folder to be the parent of the new mail folder.

order the order number of this folder in its parent folder.

type the type of the new folder (can be `M_FOLDER_MESSAGES` or `M_FOLDER_CONTACTS`).

Returns:

0 on failure, or the numerical id of the newly inserted folder in the database on success.

Definition at line 91 of file `datatier.c`.

References `mm_wipe()`, `st_char_get()`, `st_length_get()`, and `stmt_insert()`.

Referenced by `contact_folder_create()`, and `message_folder_create()`.

5.106.1.4 `bool_t magma_folder_rename(uint64_t usernum, uint64_t foldernum, uint_t type, stringer_t * rename)`

Rename a folder in the database.

Parameters:

usernum the numerical id of the user requesting the folder renaming.

foldernum the numerical id of the folder to be renamed.

type the type of the folder to be renamed (can be `M_FOLDER_MESSAGES` or `M_FOLDER_CONTACTS`).

rename a managed string containing the new name of the specified folder.

Returns:

true on success or false on failure.

Definition at line 176 of file `datatier.c`.

References `mm_wipe()`, `st_char_get()`, `st_length_get()`, and `stmt_exec_affected()`.

Referenced by `contact_folder_rename()`.

```

Functions

- void [mail_db_hide_message](#) (uint64_t messagenum)
Set a message invisible in the database.
- bool_t [mail_db_delete_message](#) (uint64_t usernum, uint64_t messagenum, uint32_t size, int_t transaction)
Delete a mail message from the mysql database and adjust the owner's quota.
- int_t [mail_db_update_message_folder](#) (uint64_t usernum, uint64_t messagenum, uint64_t source, uint64_t target, int64_t transaction)
Update a mail message's parent folder in the database.
- uint64_t [mail_db_insert_message](#) (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, int_t transaction)
Insert a mail message into the database.
- uint64_t [mail_db_insert_duplicate_message](#) (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, uint64_t created, int_t transaction)
Insert a duplicate entry for a message in the database.

5.107.1 Function Documentation

5.107.1.1 bool_t mail_db_delete_message (uint64_t usernum, uint64_t messagenum, uint32_t size, int_t transaction)

Delete a mail message from the mysql database and adjust the owner's quota. datatier.c

Parameters:

- usernum** the user id to whom the target mail message belongs.
- messagenum** the message id of the mail message to be deleted.
- size** the storage size, in bytes, of the message to be deleted.
- transaction** the mysql connection id on which to execute the statements.

Returns:

0 on failure or 1 on success.

Definition at line 41 of file datatier.c.

References [log_error](#), [mm_wipe\(\)](#), and [stmt_exec_affected_conn\(\)](#).

Referenced by [mail_remove_message\(\)](#).

5.107.1.2 void mail_db_hide_message (uint64_t messagenum)

Set a message invisible in the database.

Parameters:

- messagenum** the message id of the mail message to be hidden.

Returns:

This function returns no value.

Definition at line 15 of file `datatier.c`.

References `mm_wipe()`, and `stmt_exec()`.

Referenced by `mail_load_message()`.

5.107.1.3 `uint64_t mail_db_insert_duplicate_message (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, uint64_t created, int_t transaction)`

Insert a duplicate entry for a message in the database.

Note:

This function will also update the user's storage quota information in the database.

Parameters:

usernum the numerical id of the user that owns the message.

foldernum the numerical id of the parent folder containing the message.

status the status flags value for the message.

size the size, in bytes, of the mail message on disk.

signum the spam signature for the message.

sigkey the spam key for the message.

created the UNIX timestamp of when the message was created.

transaction the transaction id for the database operation, in case the caller wants to roll back the transaction.

Returns:

NULL on failure, or the ID of the newly inserted message on success.

Definition at line 304 of file `datatier.c`.

References `magma_t::active`, `ISNULL`, `log_pedantic`, `magma`, `MAIL_MARK_JUNK`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `stmt_exec_conn()`, `stmt_insert_conn()`, and `magma_t::storage`.

Referenced by `mail_copy_message()`.

5.107.1.4 `uint64_t mail_db_insert_message (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, int_t transaction)`

Insert a mail message into the database.

Note:

This function will also update the user's storage quota information in the database.

Parameters:

usernum the numerical id of the user to whom the mail message will belong.

foldernum the numerical id of the folder that will be the parent folder of the message.

status the status flags of the mail message.

size the size, in bytes, of the mail message on disk.

signum the spam signature for the message.

sigkey the spam key for the message.

transaction the transaction id for the database operation, in case the caller wants to roll back the transaction.

Returns:

0 on failure or the id of the newly inserted mail message on success.

Definition at line 172 of file datatier.c.

References magma_t::active, ISNULL, log_pedantic, magma, MAIL_MARK_JUNK, mm_wipe(), st_char_get(), st_length_get(), stmt_exec_conn(), stmt_insert_conn(), and magma_t::storage.

Referenced by mail_store_message().

5.107.1.5 **int_t mail_db_update_message_folder (uint64_t usernum, uint64_t messagenum, uint64_t source, uint64_t target, int64_t transaction)**

Update a mail message's parent folder in the database. usernum the numerical id of the user to whom the mail message belongs. messagenum the numerical id of the target mail message of the operation. source the numerical id of the parent folder in which the mail message currently resides. target the numerical id of the destination folder which is to be the new parent of the mail message. transaction a transaction id for the database operation, in case the caller needs to roll back changes on failure.

Returns:

-1 on failure, 0 if the target message could not be located in the database, or 1 on success.

Definition at line 100 of file datatier.c.

References log_pedantic, mm_wipe(), mysql_stmt_errno_d, mysql_stmt_error_d, pool_get_obj(), sql_pool, and stmt_exec_affected_conn().

Referenced by mail_move_message().

```
#include "magma.h"
```

Functions

- [bool_t meta_data_fetch_folder_messages](#) (uint64_t usernum, [message_folder_t](#) *folder)

Populate a message folder with all of its child messages from the database.

- void [meta_data_fetch_message_tags](#) ([meta_message_t](#) *message)

Fetch the tags for a specified message from the database.

- [bool_t meta_data_fetch_messages](#) ([meta_user_t](#) *user)

Fetch all of a user's stored messages from the database and attach them to the meta user object.

5.108.1 Function Documentation

5.108.1.1 [bool_t meta_data_fetch_folder_messages](#) (uint64_t *usernum*, [message_folder_t](#) **folder*)

Populate a message folder with all of its child messages from the database. datatier.c

Parameters:

usernum the numerical id of the user that owns the folder.

folder a pointer to the message folder object to be populated.

Returns:

true on success or false on failure.

Definition at line 16 of file datatier.c.

References [inx_append\(\)](#), [log_error](#), [log_pedantic](#), [M_TYPE_UINT64](#), [message_alloc\(\)](#), [message_free\(\)](#), [message_t](#), [mm_wipe\(\)](#), [PLACER](#), [res_field_block\(\)](#), [res_field_length\(\)](#), [res_field_uint32\(\)](#), [res_field_uint64\(\)](#), [res_row_next\(\)](#), [res_table_free\(\)](#), [stmt_get_result\(\)](#), [multi_t::u64](#), and [multi_t::val](#).

Referenced by [messages_update\(\)](#).

5.108.1.2 [void meta_data_fetch_message_tags](#) ([meta_message_t](#) **message*)

Fetch the tags for a specified message from the database.

Note:

The results of the operation will be stored in the specified meta message object's "tags" member.

Parameters:

message the meta message object for which the tags will be looked up.

Returns:

This function returns no value.

Definition at line 77 of file datatier.c.

References `ar_alloc()`, `ar_append()`, `ARRAY_TYPE_STRINGER`, `mm_wipe()`, `res_field_string()`, `res_row_count()`, `res_row_next()`, `res_table_free()`, and `stmt_get_result()`.

Referenced by `meta_data_fetch_messages()`, and `portal_endpoint_messages_tag()`.

5.108.1.3 `bool_t meta_data_fetch_messages (meta_user_t * user)`

Fetch all of a user's stored messages from the database and attach them to the meta user object.

Note:

Any of the user's existing messages will be destroyed first to allow for updates.

Parameters:

user the meta user object whose mail messages will be retrieved.

Returns:

true on success or false on failure.

TODO: Do we still need this once the refactorization is complete?

Definition at line 115 of file datatier.c.

5.109 src/objects/meta/datatier.c File Reference

```
#include "magma.h"
```

Functions

- void [meta_data_update_log](#) (meta_user_t *user, META_PROTOCOL prot)
Update the per-user entry in the Log table for the specified protocol.
- bool_t [meta_data_fetch_folders](#) (meta_user_t *user)
Retrieve all of a user's message folders from the database.
- int_t [meta_data_fetch_mailbox_aliases](#) (meta_user_t *user)
Get all the mailbox aliases for a specified user.
- int_t [meta_data_fetch_user](#) (meta_user_t *user)
Build a meta user object by username, hashed password, and hashed key storage password.
- int_t [meta_data_fetch_keys](#) (meta_user_t *user, key_pair_t *output, int64_t transaction)
Retrieve the encryption keys for a user account.
- int_t [meta_data_insert_keys](#) (uint64_t usernum, stringer_t *username, key_pair_t *input, int64_t transaction)
Store the encryption keys for a user account.
- int_t [meta_data_fetch_shard](#) (uint64_t usernum, uint16_t serial, stringer_t *label, stringer_t *output, uint_t *rotated, int64_t transaction)
Retrieve a shard value for user account.
- int_t [meta_data_insert_shard](#) (uint64_t usernum, uint16_t serial, stringer_t *label, stringer_t *shard, int64_t transaction)
Store the user realm shard value.
- bool_t [meta_data_acknowledge_alert](#) (uint64_t alertnum, uint64_t usernum, uint32_t transaction)
Mark a user alert message as acknowledged in the database.
- inx_t * [meta_data_fetch_alerts](#) (uint64_t usernum)
Get all unacknowledged alert messages for a user.
- bool_t [meta_data_flags_replace](#) (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)
Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.
- bool_t [meta_data_flags_remove](#) (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)
Remove the specified flags mask from a collection of mail messages.
- bool_t [meta_data_flags_add](#) (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)
Add the specified flags mask to a collection of mail messages.
- uint64_t [meta_data_delete_folder](#) (uint64_t usernum, uint64_t foldernum)
Delete a message folder from the database.
- uint64_t [meta_data_update_folder_name](#) (uint64_t usernum, uint64_t foldernum, stringer_t *name, uint64_t parent, uint32_t order)
Update the record for a message folder in the database.

- `uint64_t meta_data_insert_folder` (`uint64_t usernum`, `stringer_t *name`, `uint64_t parent`, `uint32_t order`)
Insert a new mail folder into the database.
- `int_t meta_data_insert_tag` (`meta_message_t *message`, `stringer_t *tag`)
Insert a tag for a message into the database.
- `int_t meta_data_truncate_tags` (`meta_message_t *message`)
Remove all tags associated with a message in the database.
- `int_t meta_data_delete_tag` (`meta_message_t *message`, `stringer_t *tag`)
Remove a tag from a message in the database.
- `inx_t * meta_data_fetch_all_tags` (`uint64_t usernum`)
Fetch all the tags attached to messages of a specified user from the database.

5.109.1 Function Documentation

5.109.1.1 `bool_t meta_data_acknowledge_alert` (`uint64_t alertnum`, `uint64_t usernum`, `uint32_t transaction`)

Mark a user alert message as acknowledged in the database. `datatier.c`

Note:

If the table is not updated immediately, another check is made to see if the alert is still pending. If so, false is returned.

Parameters:

alertnum the numerical id of the alert message to be acknowledged.

usernum the numerical id of the user to whom the alert message belongs.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

true if the alert was acknowledged successfully, or false on failure.

Definition at line 584 of file `datatier.c`.

References `log_pedantic`, `mm_wipe()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `stmt_exec_affected_conn()`, and `stmt_get_result_conn()`.

Referenced by `portal_endpoint_alert_acknowledge()`.

5.109.1.2 `uint64_t meta_data_delete_folder` (`uint64_t usernum`, `uint64_t foldernum`)

Delete a message folder from the database.

Parameters:

usernum the numerical id of the user that owns the folder to be deleted.

foldernum the folder id of the message folder to be deleted.

Returns:

1 if the message folder was successfully, or ≤ 0 if there was an error.

Definition at line 932 of file `datatier.c`.

References `M_FOLDER_MESSAGES`, `mm_wipe()`, `stmt_exec_affected()`, and `type()`.

Referenced by `imap_folder_remove()`.

5.109.1.3 `int_t meta_data_delete_tag (meta_message_t * message, stringer_t * tag)`

Remove a tag from a message in the database.

Parameters:

message a pointer to the meta message object of the message to have the tag stripped.

tag a managed string containing the name of the tag to be deleted.

Returns:

0 on success or -1 on failure.

Definition at line 1137 of file `datatier.c`.

References `mm_wipe()`, `st_char_get()`, `st_length_get()`, and `stmt_exec_affected()`.

Referenced by `portal_endpoint_messages_tag()`.

5.109.1.4 `inx_t* meta_data_fetch_alerts (uint64_t usernum)`

Get all unacknowledged alert messages for a user.

Parameters:

usernum the numerical id of the user for whom the alert messages will be fetched.

Returns:

NULL on failure, or a pointer to an `inx` holder containing all of the user's alert messages on success.

Definition at line 649 of file `datatier.c`.

References `alert_alloc()`, `inx_alloc()`, `inx_free()`, `inx_insert()`, `inx_t`, `log_error`, `log_info`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `meta_alert_t`, `mm_free()`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_length()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `stmt_get_result()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `portal_endpoint_alert_list()`.

5.109.1.5 `inx_t* meta_data_fetch_all_tags (uint64_t usernum)`

Fetch all the tags attached to messages of a specified user from the database.

Parameters:

usernum the numerical id of the user for whom the message tags will be fetched.

Returns:

NULL on failure, or an `inx` holder containing a list of all the user's messages' tags as managed strings on success.

Definition at line 1170 of file `datatier.c`.

References `inx_alloc()`, `inx_free()`, `inx_insert()`, `inx_t`, `log_error`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `res_field_string()`, `res_row_next()`, `res_table_free()`, `st_free()`, `stmt_get_result()`, `multi_t::type`, `multi_t::u64`, and `multi_t::val`.

Referenced by `portal_endpoint_messages_tags()`.

5.109.1.6 bool_t meta_data_fetch_folders (meta_user_t * user)

Retrieve all of a user's message folders from the database.

Note:

If the user already had a working set of message folders they will be deleted first.

Parameters:

user a pointer to the meta user object of the user making the request, which will be updated on success.

Returns:

-1 on failure or 1 on success.

Definition at line 58 of file datatier.c.

References `inx_alloc()`, `inx_cleanup()`, `inx_insert()`, `log_error`, `log_pedantic`, `M_FOLDER_MESSAGES`, `M_INX_LINKED`, `M_TYPE_UINT64`, `meta_folder_t`, `mm_alloc()`, `mm_copy()`, `mm_free()`, `mm_wipe()`, `res_field_block()`, `res_field_length()`, `res_field_uint32()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `stmt_get_result()`, `multi_t::type`, `type()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `meta_update_folders()`.

5.109.1.7 int_t meta_data_fetch_keys (meta_user_t * user, key_pair_t * output, int64_t transaction)

Retrieve the encryption keys for a user account.

Parameters:

user a meta object with the user number field populated.

output a key pair object to hold the results.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 307 of file datatier.c.

References `base64_decode_mod()`, `log_pedantic`, `mm_wipe()`, `PLACER`, `key_pair_t::private`, `key_pair_t::public`, `res_field_block()`, `res_field_length()`, `res_row_next()`, `res_table_free()`, `st_char_get()`, `st_empty`, `st_free()`, `st_length_int()`, and `stmt_get_result_conn()`.

Referenced by `meta_update_keys()`.

5.109.1.8 int_t meta_data_fetch_mailbox_aliases (meta_user_t * user)

Get all the mailbox aliases for a specified user.

Parameters:

user a pointer to the partially populated meta user object to be queried, with its `usenum` field set.

Returns:

true on success or false on failure.

Definition at line 159 of file datatier.c.

References `alias_alloc()`, `inx_alloc()`, `inx_cleanup()`, `inx_insert()`, `log_error`, `log_info`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `meta_alias_t`, `mm_free()`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_length()`, `res_field_uint64()`, `res_field_uint8()`, `res_row_next()`, `res_table_free()`, `st_char_get()`, `st_length_int()`, `stmt_get_result()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `meta_update_aliases()`.

5.109.1.9 `int_t meta_data_fetch_shard (uint64_t usernum, uint16_t serial, stringer_t * label, stringer_t * output, uint_t * rotated, int64_t transaction)`

Retrieve a shard value for user account.

Parameters:

- usernum* the numerical id of the user to whom the alert message belongs.
- serial* the serial number associated with the shard value.
- label* the textual label associated with the shard value.
- output* the buffer where the binary output should be stored.
- rotated* the buffer where the rotated variable is stored.
- transaction* the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

- 1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 440 of file `datatier.c`.

References `base64_decode_mod()`, `log_pedantic`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_length()`, `res_field_uint8()`, `res_row_next()`, `res_table_free()`, `st_avail_get()`, `st_char_get()`, `st_data_get()`, `st_empty`, `st_length_get()`, `st_length_int()`, `st_opt_get()`, `st_valid_destination()`, `STACIE_SHARD_LENGTH`, and `stmt_get_result_conn()`.

Referenced by `meta_update_realms()`.

5.109.1.10 `int_t meta_data_fetch_user (meta_user_t * user)`

Build a meta user object by username, hashed password, and hashed key storage password.

Parameters:

- user* a meta object with the user number field populated.

Returns:

- 1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 224 of file `datatier.c`.

References `base64_decode_mod()`, `log_pedantic`, `META_USER_ENCRYPT_DATA`, `META_USER_OVERQUOTA`, `META_USER_TLS`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_int8()`, `res_field_length()`, `res_field_string()`, `res_row_next()`, `res_table_free()`, `st_cleanup`, `st_empty`, and `stmt_get_result()`.

Referenced by `meta_update_user()`.

5.109.1.11 `bool_t meta_data_flags_add (inx_t * messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)`

Add the specified flags mask to a collection of mail messages.

Parameters:

- messages* an `inx` holder containing the collection of messages to have their flags updated.
- usernum* the numerical id of the user to whom the target messages belong, for validation purposes.
- foldernum* the numerical id of the parent folder containing the messages to be updated, for validation purposes.
- flags* a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 869 of file datatier.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `meta_message_t`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `imap_fetch()`, `imap_update_flags()`, `portal_endpoint_messages_flag()`, and `portal_endpoint_messages_tag()`.

5.109.1.12 `bool_t meta_data_flags_remove (inx_t * messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)`

Remove the specified flags mask from a collection of mail messages.

Parameters:

messages an inx holder containing the collection of messages to have their flags removed.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be stripped from any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 795 of file datatier.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `meta_message_t`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `imap_select()`, `imap_update_flags()`, `portal_endpoint_messages_flag()`, and `portal_endpoint_messages_tag()`.

5.109.1.13 `bool_t meta_data_flags_replace (inx_t * messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)`

Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.

Note:

The new mask can contain both user and system flags, but only user flags will be stripped from each message initially.

Parameters:

messages an inx holder containing the collection of messages to have their flags updated.

usernum the numerical of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 713 of file datatier.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `MAIL_STATUS_USER_FLAGS`, `meta_message_t`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `imap_update_flags()`, and `portal_endpoint_messages_flag()`.

5.109.1.14 uint64_t meta_data_insert_folder (uint64_t usernum, stringer_t * name, uint64_t parent, uint32_t order)

Insert a new mail folder into the database.

Parameters:

- usernum* the numerical id of the user to whom the new folder belongs.
- name* a managed string containing the name of the new mail folder.
- parent* the numerical id of the mail folder to be the parent of the new mail folder.
- order* the order number of this folder in its parent folder.

Returns:

0 on failure, or the numerical id of the newly inserted mail folder in the database on success.

Definition at line 1028 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), st_char_get(), st_length_get(), stmt_insert(), and type().

Referenced by imap_folder_create(), and imap_folder_rename().

5.109.1.15 int_t meta_data_insert_keys (uint64_t usernum, stringer_t * username, key_pair_t * input, int64_t transaction)

Store the encryption keys for a user account.

Parameters:

- usernum* the numerical id of the user to whom the alert message belongs.
- username* the plain text username.
- input* the public and private key pair.
- transaction* the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 372 of file datatier.c.

References base64_encode_mod(), log_pedantic, mm_wipe(), key_pair_t::private, key_pair_t::public, st_char_get(), st_cleanup, st_length_get(), st_length_int(), st_populated, and stmt_exec_affected_conn().

Referenced by meta_crypto_keys_create().

5.109.1.16 int_t meta_data_insert_shard (uint64_t usernum, uint16_t serial, stringer_t * label, stringer_t * shard, int64_t transaction)

Store the user realm shard value.

Parameters:

- usernum* the numerical id of the user to whom the alert message belongs.
- serial* the nummerid serial number associated with the shard value.
- label* the textual label associated with the shard value.
- shard* the binary shard value.
- transaction* the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 508 of file datatier.c.

References `base64_encode_mod()`, `log_pedantic`, `MANAGEDBUF`, `mm_wipe()`, `st_char_get()`, `st_data_get()`, `st_empty`, `st_length_get()`, `st_length_int()`, `STACIE_SHARD_LENGTH`, and `stmt_exec_affected_conn()`.

Referenced by `meta_update_realms()`.

5.109.1.17 int_t meta_data_insert_tag (meta_message_t * message, stringer_t * tag)

Insert a tag for a message into the database.

Parameters:

message the meta message object of the message to be tagged.

tag a managed string containing the name of the tag.

Returns:

0 on success or -1 on failure.

Definition at line 1075 of file datatier.c.

References `mm_wipe()`, `st_char_get()`, `st_length_get()`, and `stmt_exec_affected()`.

Referenced by `portal_endpoint_messages_tag()`.

5.109.1.18 int_t meta_data_truncate_tags (meta_message_t * message)

Remove all tags associated with a message in the database.

Parameters:

message a pointer to the meta message object of the message to have all of its tags stripped.

Returns:

0 on success or -1 on failure.

Definition at line 1108 of file datatier.c.

References `mm_wipe()`, and `stmt_exec_affected()`.

Referenced by `portal_endpoint_messages_tag()`.

5.109.1.19 uint64_t meta_data_update_folder_name (uint64_t usernum, uint64_t foldernum, stringer_t * name, uint64_t parent, uint32_t order)

Update the record for a message folder in the database.

Parameters:

usernum the numerical id of the user that owns the specified folder.

foldernum the id of the folder to have its properties adjusted.

name a managed string containing the new name of the specified folder.

parent the id of the new parent folder to be set for the specified message folder.

order the value of the order for the specified folder.

Returns:

1 on success, or ≤ 0 on failure.

Definition at line 972 of file `datatier.c`.

References `M_FOLDER_MESSAGES`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `stmt_exec_affected()`, and `type()`.

Referenced by `imap_folder_rename()`.

5.109.1.20 void meta_data_update_log (meta_user_t * *user*, META_PROTOCOL *prot*)

Update the per-user entry in the Log table for the specified protocol.

Note:

This function will set the last session timestamp for the user, and increment the sessions counter in the database.

Parameters:

user the meta user object of the user making the logging request.

prot the protocol associated with the log request: `META_PROT_POP`, `META_PROT_IMAP`, or `META_PROT_WEB`.

Returns:

This function returns no value.

Definition at line 20 of file `datatier.c`.

References `log_pedantic`, `META_PROTOCOL_IMAP`, `META_PROTOCOL_POP`, `META_PROTOCOL_WEB`, `mm_wipe()`, and `stmt_exec_affected()`.

Referenced by `imap_login()`, and `pop_pass()`.

```

Functions

- [inx_t * warehouse_fetch_domains](#) (void)
Fetch the list of configured domains from the database.
- [inx_t * warehouse_fetch_patterns](#) (void)
Fetch the pattern list from the database.

5.110.1 Function Documentation

5.110.1.1 inx_t* warehouse_fetch_domains (void)

Fetch the list of configured domains from the database. datatier.c

Returns:

NULL on failure, or an inx object holding all the configured domains on success.

Definition at line 14 of file datatier.c.

References [domain_alloc\(\)](#), [domain_t](#), [inx_alloc\(\)](#), [inx_free\(\)](#), [inx_insert\(\)](#), [inx_t](#), [log_check](#), [log_info](#), [log_pedantic](#), [M_INX_TREE](#), [M_TYPE_STRINGER](#), [MAGMA_HOSTNAME_MAX](#), [mm_free\(\)](#), [PLACER](#), [res_field_block\(\)](#), [res_field_int8\(\)](#), [res_field_length\(\)](#), [res_row_next\(\)](#), [res_table_free\(\)](#), [multi_t::st](#), [stmt_get_result\(\)](#), and [multi_t::val](#).

Referenced by [domain_start\(\)](#).

5.110.1.2 inx_t* warehouse_fetch_patterns (void)

Fetch the pattern list from the database.

Returns:

NULL on failure or a pointer to an inx holder containing a collection of managed strings with the patterns on success.

Definition at line 64 of file datatier.c.

References [inx_alloc\(\)](#), [inx_free\(\)](#), [inx_insert\(\)](#), [inx_t](#), [log_pedantic](#), [M_INX_LINKED](#), [M_TYPE_UINT64](#), [res_field_string\(\)](#), [res_row_next\(\)](#), [res_table_free\(\)](#), [st_free\(\)](#), [stmt_get_result\(\)](#), [multi_t::u64](#), and [multi_t::val](#).

Functions

- `int_t smtp_get_action (chr_t *string, size_t length)`
Parse an smtp event action string from the Dispatch table.
- `stringer_t * smtp_fetch_autoreply (uint64_t autoreply, uint64_t usernum)`
Fetch a specified auto-reply message for a user.
- `int_t smtp_fetch_inbound (stringer_t *address, smtp_inbound_prefs_t **output)`
Fetch a user's SMTP preferences for inbound mail.
- `table_t * smtp_fetch_rolmessages (uint64_t usernum)`
Retrieve a list, at a maximum of 20 entries, of the oldest messages owned by a user.
- `void smtp_update_receive_stats (connection_t *con, smtp_inbound_prefs_t *prefs)`
Update the receiving statistics and per-user log tables in the database for a successfully received smtp message.
- `uint64_t smtp_insert_spamsig (smtp_inbound_prefs_t *prefs, uint64_t key, int_t code)`
Store a spam signature in the database.
- `void smtp_update_transmission_stats (connection_t *con)`
Update the transmission and per-user log tables in the database for a successfully sent smtp message.
- `int_t smtp_check_transmit_quota (uint64_t usernum, size_t num_recipients, smtp_outbound_prefs_t *prefs)`
Check to see if a user's current mail send request would push them over their daily transmission quota.
- `int_t smtp_fetch_authorization (stringer_t *username, stringer_t *verification, smtp_outbound_prefs_t **output)`
Check if a user is authorized to send messages, and retrieve the user's outbound smtp preferences.
- `int_t smtp_check_receive_quota (connection_t *con, smtp_inbound_prefs_t *prefs)`
Check the user's received statistics from the database to see if receiving a message would result in a quota overage.
- `int_t smtp_check_authorized_from (uint64_t usernum, stringer_t *address)`
Check to see if a user is permitted to send email originating from a specified email address.

5.111.1 Function Documentation

5.111.1.1 int_t smtp_check_authorized_from (uint64_t usernum, stringer_t * address)

Check to see if a user is permitted to send email originating from a specified email address. datatier.c

Note:

The authorization attempt first checks against the specified email address, and if unsuccessful, upon the domain component of the email address if wildcards are enabled for that domain.

Parameters:

usenum the numerical id of the user attempting to send the mail message.

address a pointer to a managed string containing the From address value of the mail message to be sent.

Returns:

1 if the user is authorized to send email from the specified address, or 0 otherwise.

Definition at line 761 of file datatier.c.

References domain_wildcard(), mail_domain_get(), mm_wipe(), placer_t, res_row_count(), res_table_free(), st_char_get(), st_length_get(), and stmt_get_result().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.111.1.2 int_t smtp_check_receive_quota (connection_t * con, smtp_inbound_prefs_t * prefs)

Check the user's received statistics from the database to see if receiving a message would result in a quota overage.

Note:

The sum total of all emails received by the user over the past 24 hours is calculated from the database, and these checks are made: 1. The amount of mail messages received in the past 24 hours by the user does not exceed their daily mail received quota. 2. The messages received in the past 24 hours by the user from this subnet does not exceed the user's daily per-subnet received quota.

Parameters:

con a pointer to the connection object over which the smtp message was received.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

0 if message receipt is permitted, 1 if the general daily receiving limit was exceeded, 2 if the sending subnet's transmission limit was exceeded, or -1 if there was a general error.

Definition at line 696 of file datatier.c.

References con_addr_subnet(), smtp_inbound_prefs_t::daily_rcv_limit, smtp_inbound_prefs_t::daily_rcv_limit_ip, log_pedantic, mm_wipe(), number, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), st_char_get(), st_free(), st_length_get(), stmt_get_result(), uint64_conv_bl(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_rcpt_to().

5.111.1.3 int_t smtp_check_transmit_quota (uint64_t usernum, size_t num_recipients, smtp_outbound_prefs_t * prefs)

Check to see if a user's current mail send request would push them over their daily transmission quota.

Note:

This check is performed by querying the database to see how many messages a user has sent in the past 24 hour period, and by adding the current number of recipients of the pending email request to that number to see if their quota would be exceeded.

Parameters:

con a pointer to the connection object of the user attempting to send mail.

Returns:

-1 on error, 0 if the send operation is permitted, or 1 if the send operation would result in a daily send quota overage.

Definition at line 543 of file datatier.c.

References smtp_outbound_prefs_t::daily_send_limit, log_pedantic, mm_wipe(), res_field_uint64(), res_row_next(), res_table_free(), smtp_outbound_prefs_t::sent_today, and stmt_get_result().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.111.1.4 `int_t smtp_fetch_authorization (stringer_t * username, stringer_t * verification, smtp_outbound_prefs_t ** output)`

Check if a user is authorized to send messages, and retrieve the user's outbound smtp preferences.

Note:

This function first checks if the account is locked in the Users table; next it populates the user's outbound mail preferences with a combination of data from the Users and Dispatch tables. The number of messages the user has sent in the past 24 hours is also computed from the Transmitting table.

Parameters:

cred a pointer to a credential object for the user, which must be of type CREDENTIAL_AUTH.
output a pointer to the address of an outbound smtp preferences object to receive the value of the lookup.

Returns:

0 on success or < 0 for failures, and > 0 for account locks. -2: general server or database error. -1: authentication failure (invalid username/password combination). 0: successful authentication

Definition at line 594 of file `datatier.c`.

Referenced by `portal_outbound_checks()`, `smtp_auth_login()`, and `smtp_auth_plain()`.

5.111.1.5 `stringer_t* smtp_fetch_autoreply (uint64_t autoreply, uint64_t usernum)`

Fetch a specified auto-reply message for a user.

Note:

This function first checks the cache, and falls back to the database.

Parameters:

autoreply the numerical id of the auto-reply message in the database.
usernum the numerical id of the user to whom the auto-reply message belongs.

Returns:

NULL on failure, or a pointer to a managed string containing the user's auto-reply on success.

Definition at line 50 of file `datatier.c`.

References `cache_get()`, `cache_set()`, `log_pedantic`, `mm_wipe()`, `PLACER`, `res_field_string()`, `res_row_next()`, `res_table_free()`, and `stmt_get_result()`.

Referenced by `smtp_reply()`.

5.111.1.6 `int_t smtp_fetch_inbound (stringer_t * address, smtp_inbound_prefs_t ** output)`

Fetch a user's SMTP preferences for inbound mail.

Parameters:

cred a pointer to the credential object of a user with

address

Returns:

0 for success or < 0 for failures, and > 0 for account locks.

Return values:

-3,: for general server and database errors.

-2,: if the domain isn't local.

-1,: if the address is local but we didn't find a matching mailbox.

0,: everything worked

1,: the account is locked for inactivity (invalid username/password combination).

See also:

[AUTH_LOCK_INACTIVITY](#)

Return values:

2,: the account plan has expired.

See also:

[AUTH_LOCK_EXPIRED](#)

Return values:

3,: the account is subject to an administrative lock.

See also:

[AUTH_LOCK_ADMIN](#)

Return values:

4,: the account is locked due to suspicion of abuse violations.

See also:

[AUTH_LOCK_ABUSE](#)

Return values:

5,: the account has been locked at the request of the user.

See also:

[AUTH_LOCK_USER](#)

Definition at line 119 of file datatier.c.

Referenced by smtp_rcpt_to().

5.111.1.7 table_t* smtp_fetch_rollmessages (uint64_t usernum)

Retrieve a list, at a maximum of 20 entries, of the oldest messages owned by a user.

Parameters:

usernum the numerical id of the user whose messages are to be queried.

Returns:

NULL on failure, or a pointer to a sql results set containing the user's oldest messages on success.

Definition at line 345 of file datatier.c.

References log_pedantic, mm_wipe(), and stmt_get_result().

Referenced by smtp_rollout().

5.111.1.8 int_t smtp_get_action (chr_t * string, size_t length)

Parse an smtp event action string from the Dispatch table.

Note:

These values describe user-specified actions for events related to the spam filter, virus scanner, phishing detection, SPF, DKIM, and RBL checks.

Parameters:

string a pointer to a null-terminated string containing the name of the action.

length the length, in bytes, of the action string.

Returns:

the code of the corresponding smtp event action, SMTP_ACTION_UNDEFINED if the action is not known, or SMTP_ACTION_ERROR on failure.

Definition at line 18 of file datatier.c.

References log_error, PLACER, SMTP_ACTION_BOUNCE, SMTP_ACTION_DELETE, SMTP_ACTION_ERROR, SMTP_ACTION_MARK, SMTP_ACTION_MARK_READ, SMTP_ACTION_REJECT, SMTP_ACTION_UNDEFINED, and st_cmp_cs_eq().

Referenced by smtp_fetch_inbound().

5.111.1.9 uint64_t smtp_insert_spamsig (smtp_inbound_prefs_t * prefs, uint64_t key, int_t code)

Store a spam signature in the database.

See also:

dspam_process()

Parameters:

prefs a pointer to the specified user's inbound mail preferences data.
key a randomly chosen authentication key for the signature.
code the dspam return code for the message from dspam_process()

Returns:

0 on failure, or the number of the newly inserted spam signature on success.

Definition at line 446 of file datatier.c.

References log_pedantic, mm_wipe(), smtp_inbound_prefs_t::spamsig, st_char_get(), st_length_get(), stmt_insert(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_store_spamsig().

5.111.1.10 void smtp_update_receive_stats (connection_t * con, smtp_inbound_prefs_t * prefs)

Update the receiving statistics and per-user log tables in the database for a successfully received smtp message.

Note:

The Receiving table is updated with the subnet address from which the message was received; the Log table for the user is updated to reflect the newly calculated totals of bounces or messages received.

Parameters:

con the connection across which the smtp message was received.
prefs a pointer to the user's smtp inbound mail preferences.

Returns:

This function returns no value.

Definition at line 374 of file datatier.c.

References smtp_inbound_prefs_t::bounces, con_addr_subnet(), log_pedantic, mm_wipe(), PLACER, st_char_get(), st_cmp_cs_eq(), st_free(), st_length_get(), stmt_exec(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.111.1.11 void smtp_update_transmission_stats (connection_t * con)

Update the transmission and per-user log tables in the database for a successfully sent smtp message.

Note:

The Transmitting table is updated with the timestamp of this transaction; the Log table for the user is updated to reflect the newly calculated total for messages sent.

Parameters:

con a pointer to the connection object across which the smtp message was sent.
prefs a pointer to the user's smtp inbound mail preferences.

Returns:

This function returns no value.

Definition at line 498 of file `datatier.c`.

References `log_pedantic`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `smtp_data_outbound()`.

```
#include "magma.h"
```

Functions

- `inx_t * register_data_fetch_blocklist` (void)
Fetch the blocklist for new user registration from the database.
- `bool_t register_data_check_username` (stringer_t *username)
Check to see if a username requested by a registration attempt has already been taken.
- `int_t register_data_insert_user` (connection_t *con, uint16_t plan, stringer_t *username, stringer_t *password, int64_t transaction, uint64_t *outuser)
Insert a newly registered user into the database using information gathered by registration step #2.

5.112.1 Function Documentation

5.112.1.1 bool_t register_data_check_username (stringer_t * username)

Check to see if a username requested by a registration attempt has already been taken. datatier.c

Parameters:

username the username to be checked against the database.

Returns:

true if the username is taken or false if it is not.

Definition at line 67 of file datatier.c.

References `mm_wipe()`, `res_row_next()`, `res_table_free()`, `st_char_get()`, `st_length_get()`, and `stmt_get_result()`.

Referenced by `register_business_step1()`.

5.112.1.2 inx_t* register_data_fetch_blocklist (void)

Fetch the blocklist for new user registration from the database. HIGH: The prepared statements being used aren't valid. The queries need to be copied over and created. `register_fetch_blocklist` still needs to be defined.

Returns:

an inx holder containing the registration blocklist as a collection of managed strings.

Definition at line 18 of file datatier.c.

References `inx_alloc()`, `inx_free()`, `inx_insert()`, `inx_t`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `res_field_string()`, `res_row_next()`, `res_table_free()`, `st_free()`, `stmt_get_result()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `register_blocklist_update()`.

5.112.1.3 `int_t register_data_insert_user(connection_t * con, uint16_t plan, stringer_t * username, stringer_t * password, int64_t transaction, uint64_t * outuser)`

Insert a newly registered user into the database using information gathered by registration step #2.

Note:

The following steps occur: 1. Insert a new user into the Users table, supplying username, hashed password, plan info, and quota. 2. Insert a random shard value into the User_Realms table. 3. Insert a blank entry into the Profile table for the user. 4. Insert an entry into the Folders table for the user's "Inbox" folder. 5. Insert a new entry into the Log table containing the usernum and IP address of the client request. 6. Insert a new entry into the Dispatch table for the user, configuring the spam folder, inbox, send/receive/daily send/daily receive limits, etc. 7. Insert a new entry into the Mailboxes table for the user.

Parameters:

con a pointer to the connection object of the client making the registration request.

reg the current registration session of the user to be added.

transaction a mysql transaction id for all database operations, since they all need to be committed atomically or rolled back.

outuser a pointer to a numerical id to receive the newly generated and inserted user id.

Returns:

0 if the new user account was successfully created, -1 if a technical error occurs, and 1 if an invalid value is provided.

LOW: This function should be passed a number of days (or years) to use for any of the pre-paid account plans. LOW: The IP address could be passed in as an `ip_t` or as a string to avoid the need for the entire connection object.

Definition at line 114 of file `datatier.c`.

```
#include "magma.h"
```

Functions

- void `teacher_data_free` (`teacher_data_t` *`teach`)
Free a spam signature object.
- void `teacher_data_delete` (`teacher_data_t` *`teach`)
Delete spam signature information from the database.
- `teacher_data_t` * `teacher_data_fetch` (uint64_t `signum`)
Fetch information about a spam signature from the database.
- void `teacher_data_save` (`teacher_data_t` *`teach`)
Save spam signature information to the cache.
- `teacher_data_t` * `teacher_data_get` (uint64_t `signum`)
Get information about a spam signature from the cache, or fall back to the database.

5.114.1 Function Documentation

5.114.1.1 void `teacher_data_delete` (`teacher_data_t` * `teach`)

Delete spam signature information from the database. `datatier.c`

HIGH: After training a signature, we should search the messages table for references to the signature being trained and update the message status flags. The `UPDATE_SIGNATURE_FLAGS_ADD/UPDATE_SIGNATURE_FLAGS_REMOVE` queries were created for that purpose but aren't being used right now. Note to self: retroactively brand messages as junk accordingly.

Note:

If the signature matched junk, all matching messages in the database belonging to the user will have their junk flag cleared. But if the signature didn't match junk, all matching messages in the database belonging to the user will have the junk flag added.

Parameters:

`teach` the spam signature to be removed from the database.

Returns:

This function returns no value.

Definition at line 38 of file `datatier.c`.

References `teacher_data_t::completed`, `teacher_data_t::disposition`, `log_pedantic`, `MAIL_MARK_JUNK`, `mm_wipe()`, `teacher_data_t::password`, `teacher_data_t::signature`, `teacher_data_t::signum`, `st_cleanup`, `stmt_exec()`, `teacher_data_t::username`, and `teacher_data_t::usernum`.

Referenced by `teacher_process()`.

5.114.1.2 **teacher_data_t* teacher_data_fetch (uint64_t *signum*)**

Fetch information about a spam signature from the database.

Parameters:

signum the numerical id of the spam signature to be retrieved.

NULL on failure, or a pointer to a newly allocated signature teacher object on success.

Definition at line 137 of file datatier.c.

References teacher_data_t::disposition, teacher_data_t::keynum, mm_alloc(), mm_wipe(), teacher_data_t::password, res_field_int8(), res_field_string(), res_field_uint64(), res_row_next(), res_table_free(), teacher_data_t::signature, teacher_data_t::signum, stmt_get_result(), teacher_data_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_data_get().

5.114.1.3 **void teacher_data_free (teacher_data_t * *teach*)**

Free a spam signature object.

Parameters:

teach the spam signature object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file datatier.c.

References mm_free(), teacher_data_t::password, teacher_data_t::signature, st_cleanup, and teacher_data_t::username.

Referenced by teacher_data_fetch(), teacher_data_get(), and teacher_process().

5.114.1.4 **teacher_data_t* teacher_data_get (uint64_t *signum*)**

Get information about a spam signature from the cache, or fall back to the database.

Parameters:

signum the numerical id of the spam signature to be retrieved.

NULL on failure, or a pointer to a newly allocated signature teacher object on success.

Definition at line 229 of file datatier.c.

References cache_get(), teacher_data_t::completed, data, deserialize_int32(), deserialize_st(), deserialize_uint64(), teacher_data_t::disposition, teacher_data_t::keynum, log_pedantic, mm_alloc(), mm_wipe(), teacher_data_t::password, PLACER, serialization_t, teacher_data_t::signature, teacher_data_t::signum, st_free(), teacher_data_fetch(), teacher_data_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_process().

5.114.1.5 **void teacher_data_save (teacher_data_t * *teach*)**

Save spam signature information to the cache.

Note:

The information will be cached for 2 hours.

Parameters:

teach the spam signature to be cached.

Returns:

This function returns no value.

Definition at line 189 of file datatier.c.

References `cache_set()`, `teacher_data_t::completed`, `data`, `teacher_data_t::disposition`, `teacher_data_t::keynum`, `log_pedantic`, `teacher_data_t::password`, `PLACER`, `serialize_int32()`, `serialize_st()`, `serialize_uint64()`, `teacher_data_t::signature`, `teacher_data_t::signum`, `st_free()`, `teacher_data_t::username`, and `teacher_data_t::usernum`.

Referenced by `teacher_process()`.

5.115 src/engine/config/global/global.c File Reference

```
#include "magma.h"

- magma_t [magma](#) = { .config.file = "magma.config" }
- bool_t [exit_and_dump](#) = false
- stringer_t * [cmdline_config_data](#) = NULL

5.115.1 Function Documentation

5.115.1.1 void config_free (void)

LOW: We should use use `basename()` and `dirname()` to cleanup path strings. [global.c](#)

Free all loaded magma configuration options.

Note:

First all magma config keys will be freed, then the cache servers, relay servers, and magma servers.

Returns:

This function returns no value.

Definition at line 23 of file `global.c`.

References `magma_t::blacklists`, `cache_free()`, `log_pedantic`, `M_TYPE_BLOCK`, `M_TYPE_BOOLEAN`, `M_TYPE_DOUBLE`, `M_TYPE_ENUM`, `M_TYPE_FLOAT`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `magma_keys`, `mm_free()`, `magma_keys_t::norm`, `ns_free()`, `NULLER`, `PLACER`, `relay_free()`, `servers_free()`, `magma_t::smtp`, `st_cmp_cs_eq()`, `st_free()`, `store`, `type()`, and `multi_t::type`.

Referenced by `config_load_defaults()`, and `process_stop()`.

5.115.1.2 magma_keys_t* config_key_lookup (stringer_t * name)

Get a magma config key by name.

Parameters:

name a managed string with the name of the magma config option to be looked up.

Returns:

NULL on failure or a pointer to the found magma key object on success.

Definition at line 726 of file `global.c`.

References `magma_keys`, `NULLER`, and `st_cmp_ci_eq()`.

Referenced by `config_load_cmdline_settings()`, `config_load_database_settings()`, `config_load_file_settings()`, and `config_validate_settings()`.

5.115.1.3 bool_t config_load_cmdline_settings (void)

Load all magma configuration options specified by the user on the command line.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 943 of file `global.c`.

References `cache_config()`, `cmdline_config_data`, `config_key_lookup()`, `config_value_set()`, `CONSTANT`, `magma_keys_t::file`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_key_next()`, `inx_cursor_t`, `inx_cursor_value_active()`, `log_critical`, `log_warn`, `mt_is_empty()`, `magma_keys_t::name`, `nvp_alloc()`, `nvp_free()`, `nvp_parse()`, `nvp_t::pairs`, `relay_config()`, `magma_keys_t::required`, `servers_config()`, `magma_keys_t::set`, `multi_t::st`, `st_char_get()`, `st_cmp_ci_starts()`, `st_empty`, `st_free()`, `st_length_int()`, and `multi_t::val`.

Referenced by `process_start()`.

5.115.1.4 `bool_t config_load_database_settings (void)`

Load all magma configuration options present in the database.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 850 of file `global.c`.

References `cache_config()`, `config_fetch_host_number()`, `config_fetch_settings()`, `config_key_lookup()`, `config_value_set()`, `CONSTANT`, `magma_keys_t::database`, `magma_t::host`, `log_critical`, `log_warn`, `magma_keys_t::name`, `magma_t::number`, `magma_keys_t::overwrite`, `PLACER`, `relay_config()`, `magma_keys_t::required`, `res_field_block()`, `res_field_length()`, `res_row_count()`, `res_row_get()`, `res_table_free()`, `servers_config()`, `magma_keys_t::set`, `st_char_get()`, `st_cmp_ci_eq()`, `st_cmp_ci_starts()`, `st_empty`, and `st_length_int()`.

Referenced by `process_start()`.

5.115.1.5 `bool_t config_load_defaults (void)`

Load all the default values for non-required configuration options.

Returns:

true if all default magma config values were successfully loaded, or false on failure.

Definition at line 701 of file `global.c`.

References `config_free()`, `config_value_set()`, `log_info`, and `magma_keys`.

Referenced by `args_parse()`, and `process_start()`.

5.115.1.6 `bool_t config_load_file_settings (void)`

Load the magma configuration file specified in `magma.config.file`, or from the command line.

Note:

Parses the config file data into a series of name/value pairs, and make sure that for each key: If a config option was loaded from the file, the key must allow it to be configurable via the file, and If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all config file options were parsed and evaluated successfully, or false on failure.

Definition at line 748 of file global.c.

References `cache_config()`, `magma_t::config`, `config_key_lookup()`, `config_value_set()`, `CONSTANT`, `magma_keys_t::file`, `magma_t::file`, `file_load()`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_key_next()`, `inx_cursor_t`, `inx_cursor_value_active()`, `log_critical`, `mt_is_empty()`, `magma_keys_t::name`, `nvp_alloc()`, `nvp_free()`, `nvp_parse()`, `nvp_t::pairs`, `relay_config()`, `magma_keys_t::required`, `servers_config()`, `magma_keys_t::set`, `multi_t::st`, `st_char_get()`, `st_cmp_ci_starts()`, `st_empty`, `st_free()`, `st_length_int()`, and `multi_t::val`.

Referenced by `process_start()`.

5.115.1.7 void config_output_help (void)

Log all magma config key settings, as well as server, relay server, and cache server settings.

Returns:

This function returns no value.

Definition at line 291 of file global.c.

References `multi_t::bl`, `cache_output_help()`, `config_output_value_generic()`, `log_info`, `log_options`, `M_LOG_FILE_DISABLE`, `M_LOG_FUNCTION_DISABLE`, `M_LOG_LINE_DISABLE`, `M_LOG_LINE_FEED_DISABLE`, `M_LOG_STACK_TRACE_DISABLE`, `M_LOG_TIME_DISABLE`, `magma_keys`, `magma_keys_t::norm`, `relay_output_help()`, `magma_keys_t::required`, `servers_output_help()`, and `multi_t::val`.

Referenced by `args_parse()`.

5.115.1.8 void config_output_settings (void)

Log a display of all active magma configuration settings.

Returns:

This function returns no value.

Definition at line 264 of file global.c.

References `cache_output_settings()`, `magma_t::config`, `config_output_value()`, `magma_t::file`, `magma_t::host`, `log_info`, `magma_keys`, `magma_t::name`, `magma_t::number`, `relay_output_settings()`, and `servers_output_settings()`.

Referenced by `config_validate_settings()`.

5.115.1.9 void config_output_value (magma_keys_t * key)

Log the contents of a magma configuration option.

Parameters:

key a pointer to the magma configuration key to be dumped.

Returns:

This function returns no value.

Definition at line 192 of file global.c.

References `magma_t::blacklists`, `log_info`, `log_pedantic`, `M_TYPE_BOOLEAN`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `magma_keys_t::name`, `magma_keys_t::norm`, `ns_empty()`, `NULLER`, `PLACER`, `magma_t::smtp`, `st_char_get()`, `st_cmp_cs_eq()`, `st_empty`, `st_length_int()`, `magma_keys_t::store`, and `multi_t::type`.

Referenced by `config_output_settings()`.

5.115.1.10 void config_output_value_generic (chr_t * *prefix*, chr_t * *name*, M_TYPE *type*, void * *val*, bool_t *required*)

Output a key name and value in a generic way.

Parameters:

- prefix* a pointer to a null-terminated string containing an optional prefix to be printed before the supplied key name.
- name* a pointer to a null-terminated string containing the name of the key being output.
- type* an M_TYPE value specifying the multi-type of the key value.
- val* a void pointer to the value of the specified key, which will be printed in accordance with the supplied multi-type.
- required* a boolean value specifying whether the specified key is a required configuration option.

Returns:

This function returns no value.

Definition at line 78 of file global.c.

References magma_t::blacklists, CONSTANT, DMTP, GENERIC, HTTP, IMAP, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MOLTEN, ns_empty(), NULLER, PLACER, POP, SMTP, magma_t::smtp, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), SUBMISSION, TCP_PORT, and TLS_PORT.

Referenced by cache_output_help(), config_output_help(), relay_output_help(), and servers_output_help().

5.115.1.11 bool_t config_validate_settings (void)

Validate all the user configuration settings.

Note:

The steps are as follows: 1. Check to see that all required keys have been set. 2. If magma.iface.virus.available is set, magma.iface.virus.signatures must be set. 3. Make sure $10 \leq \text{magma.iface.cache.retry} \leq 86400$ 4. Make sure $1 \leq \text{magma.iface.cache.timeout} \leq 3600$ 5. Make sure $\text{magma.iface.cache.retry} \leq \text{magma.iface.cache.timeout}$ 6. Make sure $40 \leq \text{magma.smtp.wrap_line_length} \leq 65535$ 7. Make sure $8 \leq \text{magma.smtp.recipient_limit} \leq 32768$ 8. Make sure $16 \leq \text{magma.smtp.relay_limit}$ 9. Make sure $16384 \leq \text{system_ulimit_max}(\text{RLIMIT_STACK})$ 10. If magma.system.daemonize is set, make sure magma.output.file is not false 11. If magma.output.file is enabled, magma.output.path must be set. 12. If [magma.dkim.enabled](#) is set, then magma.dkim.domain, magma.dkim.selector, and magma.dkim.key must all be set. 13. Validate all the configured magma servers, relay servers, and cache servers. 14. Check all config key filenames and directories to ensure that they exist and are accessible. 15. Make sure magma.admin.contact and point to valid email addresses, if they are specified. 16. If magma.config.output_config is set, dump the current configuration.

Definition at line 329 of file global.c.

References magma_t::abuse, magma_t::admin, magma_t::cache, cache_validate(), magma_t::config, CONFIG_CHECK_DIR_READABLE, CONFIG_CHECK_DIR_READWRITE, CONFIG_CHECK_FILE_READABLE, config_key_lookup(), config_output_settings(), magma_t::contact, contact_business_valid_email(), magma_t::daemonize, magma_t::dime, magma_t::dkim, magma_t::domain, magma_t::enabled, exit_and_dump, magma_t::file, magma_t::http, magma_t::iface, magma_t::key, magma_t::library, log_critical, log_warn, magma_keys, magma_t::minimum_password_length, magma_t::output, magma_t::output_config, magma_t::path, PLACER, magma_t::recipient_limit, magma_t::relay_limit, relay_validate(), magma_t::root_directory, magma_t::secure, magma_t::selector, servers_validate(), magma_keys_t::set, magma_t::signet, magma_t::smtp, magma_t::spool, st_char_get(), magma_t::system, system_ulimit_max(), magma_t::thread_stack_size, magma_t::virus, and magma_t::wrap_line_length.

Referenced by process_start().

5.115.1.12 bool_t config_value_set (magma_keys_t * *setting*, stringer_t * *value*)

Set the value of a global config key.

Note:

This function will also free the value of the global config key if it has already previously been set.

Parameters:

setting a pointer to the global key to have its value adjusted.

value a managed string containing the new key value, or if NULL, the key's default value will be used.

Returns:

true if the specified key's value was set successfully, or false on failure.

LOW: Realtime blacklist domains are handled using custom code because we don't yet have a generic type to store lists.

Definition at line 515 of file global.c.

5.116.1 Function Documentation

5.116.1.1 uint64_t config_fetch_host_number (void)

datatier.c datatier.c

Returns:

this host's numerical identifier, or 0 on failure.

Definition at line 14 of file datatier.c.

References magma_t::host, log_error, magma, mm_wipe(), magma_t::name, ns_length_get(), res_field_uint64(), res_row_next(), res_table_free(), and stmt_get_result().

Referenced by config_load_database_settings().

5.116.1.2 table_t* config_fetch_settings (void)

Retrieve the entire collection of configuration key/value pairs from the database.

Parameters:

none This function accepts no parameters.

Returns:

NULL on failure, or a database table of configuration key/value pairs on success.

Definition at line 40 of file datatier.c.

References magma_t::host, magma, mm_wipe(), magma_t::name, ns_length_get(), and stmt_get_result().

Referenced by config_load_database_settings().

5.116.1.3 void config_free (void)

[global.c](#) [global.c](#)

Free all loaded magma configuration options.

Note:

First all magma config keys will be freed, then the cache servers, relay servers, and magma servers.

Returns:

This function returns no value.

Definition at line 23 of file global.c.

References magma_t::blacklists, cache_free(), log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma_keys, mm_free(), magma_keys_t::norm, ns_free(), NULLER, PLACER, relay_free(), servers_free(), magma_t::smtp, st_cmp_cs_eq(), st_free(), store, type(), and multi_t::type.

Referenced by config_load_defaults(), and process_stop().

5.116.1.4 magma_keys_t* config_key_lookup (stringer_t * name)

Get a magma config key by name.

Parameters:

name a managed string with the name of the magma config option to be looked up.

Returns:

NULL on failure or a pointer to the found magma key object on success.

Definition at line 726 of file global.c.

References magma_keys, NULLER, and st_cmp_ci_eq().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), and config_validate_settings().

5.116.1.5 bool_t config_load_cmdline_settings (void)

Load all magma configuration options specified by the user on the command line.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 943 of file global.c.

References cache_config(), cmdline_config_data, config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::file, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_key_next(), inx_cursor_t, inx_cursor_value_active(), log_critical, log_warn, mt_is_empty(), magma_keys_t::name, nvp_alloc(), nvp_free(), nvp_parse(), nvp_t::pairs, relay_config(), magma_keys_t::required, servers_config(), magma_keys_t::set, multi_t::st, st_char_get(), st_cmp_ci_starts(), st_empty, st_free(), st_length_int(), and multi_t::val.

Referenced by process_start().

5.116.1.6 bool_t config_load_database_settings (void)

Load all magma configuration options present in the database.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 850 of file global.c.

References cache_config(), config_fetch_host_number(), config_fetch_settings(), config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::database, magma_t::host, log_critical, log_warn, magma_keys_t::name, magma_t::number, magma_keys_t::overwrite,

PLACER, relay_config(), magma_keys_t::required, res_field_block(), res_field_length(), res_row_count(), res_row_get(), res_table_free(), servers_config(), magma_keys_t::set, st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_empty, and st_length_int().

Referenced by process_start().

5.116.1.7 bool_t config_load_defaults (void)

Load all the default values for non-required configuration options.

Returns:

true if all default magma config values were successfully loaded, or false on failure.

Definition at line 701 of file global.c.

References config_free(), config_value_set(), log_info, and magma_keys.

Referenced by args_parse(), and process_start().

5.116.1.8 bool_t config_load_file_settings (void)

Load the magma configuration file specified in magma.config.file, or from the command line.

Note:

Parses the config file data into a series of name/value pairs, and make sure that for each key: If a config option was loaded from the file, the key must allow it to be configurable via the file, and If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all config file options were parsed and evaluated successfully, or false on failure.

Definition at line 748 of file global.c.

References cache_config(), magma_t::config, config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::file, magma_t::file, file_load(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_key_next(), inx_cursor_t, inx_cursor_value_active(), log_critical, mt_is_empty(), magma_keys_t::name, nvp_alloc(), nvp_free(), nvp_parse(), nvp_t::pairs, relay_config(), magma_keys_t::required, servers_config(), magma_keys_t::set, multi_t::st, st_char_get(), st_cmp_ci_starts(), st_empty, st_free(), st_length_int(), and multi_t::val.

Referenced by process_start().

5.116.1.9 void config_output_help (void)

Log all magma config key settings, as well as server, relay server, and cache server settings.

Returns:

This function returns no value.

Definition at line 291 of file global.c.

References multi_t::bl, cache_output_help(), config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, magma_keys, magma_keys_t::norm, relay_output_help(), magma_keys_t::required, servers_output_help(), and multi_t::val.

Referenced by args_parse().

5.116.1.10 void config_output_settings (void)

Log a display of all active magma configuration settings.

Returns:

This function returns no value.

Definition at line 264 of file global.c.

References cache_output_settings(), magma_t::config, config_output_value(), magma_t::file, magma_t::host, log_info, magma_keys, magma_t::name, magma_t::number, relay_output_settings(), and servers_output_settings().

Referenced by config_validate_settings().

5.116.1.11 void config_output_value (magma_keys_t * key)

Log the contents of a magma configuration option.

Parameters:

key a pointer to the magma configuration key to be dumped.

Returns:

This function returns no value.

Definition at line 192 of file global.c.

References magma_t::blacklists, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma_keys_t::name, magma_keys_t::norm, ns_empty(), NULLER, PLACER, magma_t::smtp, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), magma_keys_t::store, and multi_t::type.

Referenced by config_output_settings().

5.116.1.12 void config_output_value_generic (chr_t * prefix, chr_t * name, M_TYPE type, void * val, bool_t required)

Output a key name and value in a generic way.

Parameters:

prefix a pointer to a null-terminated string containing an optional prefix to be printed before the supplied key name.

name a pointer to a null-terminated string containing the name of the key being output.

type an M_TYPE value specifying the multi-type of the key value.

val a void pointer to the value of the specified key, which will be printed in accordance with the supplied multi-type.

required a boolean value specifying whether the specified key is a required configuration option.

Returns:

This function returns no value.

Definition at line 78 of file global.c.

References magma_t::blacklists, CONSTANT, DMTP, GENERIC, HTTP, IMAP, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MOLTEN, ns_empty(), NULLER, PLACER, POP, SMTP, magma_t::smtp, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), SUBMISSION, TCP_PORT, and TLS_PORT.

Referenced by cache_output_help(), config_output_help(), relay_output_help(), and servers_output_help().

5.116.1.13 `bool_t config_validate_settings(void)`

Validate all the user configuration settings.

Note:

The steps are as follows: 1. Check to see that all required keys have been set. 2. If `magma.iface.virus.available` is set, `magma.iface.virus.signatures` must be set. 3. Make sure `10 <= magma.iface.cache.retry <= 86400` 4. Make sure `1 <= magma.iface.cache.timeout <= 3600` 5. Make sure `magma.iface.cache.retry <= magma.iface.cache.timeout` 6. Make sure `40 <= magma.smtp.wrap_line_length <= 65535` 7. Make sure `8 <= magma.smtp.recipient_limit <= 32768` 8. Make sure `16 <= magma.smtp.relay_limit` 9. Make sure `16384 <= system_ulimit_max(RLIMIT_STACK)` 10. If `magma.system.daemonize` is set, make sure `magma.output.file` is not false 11. If `magma.output.file` is enabled, `magma.output.path` must be set. 12. If `magma.dkim.enabled` is set, then `magma.dkim.domain`, `magma.dkim.selector`, and `magma.dkim.key` must all be set. 13. Validate all the configured magma servers, relay servers, and cache servers. 14. Check all config key filenames and directories to ensure that they exist and are accessible. 15. Make sure `magma.admin.contact` and point to valid email addresses, if they are specified. 16. If `magma.config.output_config` is set, dump the current configuration.

Definition at line 329 of file `global.c`.

Referenced by `process_start()`.

5.116.1.14 `bool_t config_value_set(magma_keys_t *setting, stringer_t *value)`

Set the value of a global config key.

Note:

This function will also free the value of the global config key if it has already previously been set.

Parameters:

setting a pointer to the global key to have its value adjusted.

value a managed string containing the new key value, or if NULL, the key's default value will be used.

Returns:

true if the specified key's value was set successfully, or false on failure.

LOW: Realtime blacklist domains are handled using custom code because we don't yet have a generic type to store lists.

Log all relay key information to be returned via "magma -h".

5.117.1 Function Documentation

5.117.1.1 relay_t* relay_alloc (uint32_t *number*)

Allocate and initialize a magma server relay object, or return it if it already exists.

Parameters:

number a zero-based index into the global relay server table where the entry should be created and/or queried.

Returns:

NULL on failure, or a pointer to the requested relay server object on success.

Definition at line 86 of file relay.c.

References magma_t::host, log_critical, magma, mm_alloc(), magma_t::relay, relay_keys, and relay_set_value().

Referenced by relay_config().

5.117.1.2 bool_t relay_config (stringer_t * *name*, stringer_t * *value*)

Set the value of a relay server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new relay server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable relay server configuration parameter to be set.

value a managed string containing the new value of the relay server config key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 448 of file relay.c.

References `bracket_extract_pl()`, `CONSTANT`, `log_critical`, `MAGMA_RELAY_INSTANCES`, `NULLER`, `pl_char_get()`, `pl_empty()`, `pl_length_get()`, `PLACER`, `placer_t`, `relay_alloc()`, `relay_keys`, `relay_set_value()`, `st_char_get()`, `st_cmp_ci_eq()`, `st_cmp_ci_starts()`, `st_length_get()`, `st_length_int()`, and `uint32_conv_bl()`.

Referenced by `config_load_cmdline_settings()`, `config_load_database_settings()`, and `config_load_file_settings()`.

5.117.1.3 void relay_counter (void)

Update the relay server counters to reflect the number of configured standard and premium relay servers.

Returns:

This function returns no value.

Definition at line 16 of file relay.c.

References `magma_t::count`, `magma_t::host`, `magma`, `MAGMA_RELAY_INSTANCES`, `magma_t::premium`, and `magma_t::relay`.

Referenced by `relay_set_value()`.

5.117.1.4 void relay_free (void)

Free magma's relay server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 39 of file relay.c.

References `magma_t::host`, `log_pedantic`, `M_TYPE_BLOCK`, `M_TYPE_BOOLEAN`, `M_TYPE_DOUBLE`, `M_TYPE_ENUM`, `M_TYPE_FLOAT`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `magma`, `MAGMA_RELAY_INSTANCES`, `mm_free()`, `relay_keys_t::norm`, `ns_empty()`, `ns_free()`, `relay_keys_t::offset`, `magma_t::relay`, `relay_keys`, `st_empty`, `st_free()`, `type()`, and `multi_t::type`.

Referenced by `config_free()`.

5.117.1.5 void relay_output_help (void)

Log all relay key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 508 of file relay.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, relay_keys_t::norm, relay_keys, relay_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.117.1.6 void relay_output_settings (void)

Definition at line 228 of file relay.c.

References magma_t::host, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(), relay_keys_t::offset, magma_t::relay, relay_keys, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.117.1.7 bool_t relay_set_value (relay_keys_t * setting, relay_t * relay, stringer_t * value)

Set a specified key for a relay server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the relay server configuration key to be set.

relay a pointer to the relay server configuration entry to be adjusted.

value a managed string containing the new value of the config key.

Returns:

true if the value was successfully set, or false on error.

Definition at line 303 of file relay.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, relay_keys_t::name, relay_keys_t::norm, multi_t::ns, ns_dup(), ns_empty(), ns_free(), ns_import(), relay_keys_t::offset, relay_counter(), multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dup_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by relay_alloc(), and relay_config().

5.117.1.8 bool_t relay_validate (void)

Validate all of the configured magma relay server instances. Iterates through all of the server structures and verifies that each was supplied with valid values for all of its required keys. This function also applies the application specific validation rules. Specifically it verifies that only one server structure has been configured to use a given port number.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all relay servers have been validated, or false on failure.

Definition at line 115 of file relay.c.

Functions

- void `smtp_client_close` (`client_t` *client)
Issue an smtp client QUIT command.
- `client_t` * `smtp_client_connect` (`int_t` premium)
Connect to a randomly selected mail relay server, and wait for a successful banner message.
- `int_t` `smtp_client_send_helo` (`client_t` *client)
Issue a EHLO command to an smtp server, or fall back to HELO, and wait for a successful response.
- `int_t` `smtp_client_send_mailfrom` (`client_t` *client, `stringer_t` *mailfrom, `size_t` send_size)
Issue a MAIL FROM command to an smtp server, and wait for a successful response.
- `int_t` `smtp_client_send_nullfrom` (`client_t` *client)
Issue a MAIL FROM command to an smtp server with a null sender, and wait for a successful response.
- `int_t` `smtp_client_send_rcptto` (`client_t` *client, `stringer_t` *rcptto)
Issue a RCPT TO command to an smtp server, and wait for a successful response.
- `int_t` `smtp_client_send_data` (`client_t` *client, `stringer_t` *message, `bool_t` dotstuffed)
Issue a DATA command to an smtp server, and wait for a successful response.

5.118.1 Function Documentation

5.118.1.1 void smtp_client_close (client_t * client)

Issue an smtp client QUIT command. relay.c

Parameters:

client a pointer to the smtp client session to be closed.

Returns:

This function returns no value.

Definition at line 15 of file relay.c.

References `client_close()`, `client_read_line()`, `client_write()`, and `PLACER`.

Referenced by `portal_smtp_relay_message()`, `smtp_bounce()`, `smtp_forward_message()`, `smtp_relay_message()`, `smtp_reply()`, and `smtp_send_message()`.

5.118.1.2 client_t* smtp_client_connect (int_t premium)

Connect to a randomly selected mail relay server, and wait for a successful banner message.

Parameters:

premium if set, a premium relay will be selected instead of a standard one.

Returns:

NULL on failure or a pointer to the newly established network client object connected to a mail relay on success.

Definition at line 31 of file relay.c.

References `client_close()`, `client_connect()`, `client_read_line()`, `client_secure()`, `client_t`, `magma_t::count`, `magma_t::host`, `log_pedantic`, `magma`, `MAGMA_RELAY_INSTANCES`, `relay_t::name`, `net_set_timeout()`, `relay_t::port`, `magma_t::premium`, `rand_get_uint32()`, `magma_t::relay`, `relay_t::secure`, `st_char_get()`, `st_length_get()`, `st_length_int()`, and `magma_t::timeout`.

Referenced by `portal_smtp_relay_message()`, `smtp_bounce()`, `smtp_forward_message()`, `smtp_relay_message()`, `smtp_reply()`, and `smtp_send_message()`.

5.118.1.3 int_t smtp_client_send_data (client_t * client, stringer_t * message, bool_t dotstuffed)

Issue a DATA command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the DATA command.

message a pointer to a managed string containing the body of the message to be sent.

dotstuffed a boolean to where true indicates the supplied message has already been dotstuffed.

Returns:

-3 for internal errors, -2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 243 of file relay.c.

References `client_read_line()`, `client_write()`, `HEAP`, `JOINTED`, `log_pedantic`, `MANAGEDBUF`, `MAPPED_T`, `pl_char_get()`, `pl_length_int()`, `pl_starts_with_char()`, `PLACER`, `st_char_get()`, `st_cleanup`, `st_cmp_cs_ends()`, `st_dupe_opts()`, `st_empty`, `st_length_get()`, `st_length_int()`, `st_quick()`, and `st_replace()`.

Referenced by `portal_smtp_relay_message()`, `smtp_bounce()`, `smtp_forward_message()`, `smtp_relay_message()`, `smtp_reply()`, and `smtp_send_message()`.

5.118.1.4 int_t smtp_client_send_helo (client_t * client)

Issue a EHLO command to an smtp server, or fall back to HELO, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the remote command.

Returns:

-1 on failure or 1 on success.

Definition at line 110 of file relay.c.

References `client_print()`, `client_read_line()`, `magma_t::domain`, `magma_t::host`, `log_pedantic`, `magma`, `magma_t::name`, `ns_length_get()`, `pl_init()`, `pl_null()`, `placer_t`, `st_char_get()`, `st_empty`, `st_length_get()`, and `magma_t::system`.

Referenced by `portal_smtp_relay_message()`, `smtp_bounce()`, `smtp_forward_message()`, `smtp_relay_message()`, `smtp_reply()`, and `smtp_send_message()`.

5.118.1.5 int_t smtp_client_send_mailfrom (client_t * client, stringer_t * mailfrom, size_t send_size)

Issue a MAIL FROM command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the MAIL FROM command.
mailfrom a pointer to a managed string containing the address parameter for the MAIL FROM command.
send_size if greater than 0, specify the optional SIZE parameter to the MAIL FROM command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

LOW: Technically we should only be sending the size parameter if the EHLO response indicates support.

Definition at line 168 of file relay.c.

References client_print(), client_read_line(), log_pedantic, st_char_get(), st_length_get(), and st_length_int().

Referenced by portal_smtp_relay_message(), smtp_forward_message(), smtp_relay_message(), and smtp_send_message().

5.118.1.6 int_t smtp_client_send_nullfrom (client_t * client)

Issue a MAIL FROM command to an smtp server with a null sender, and wait for a successful response.

Note:

Null senders are used when the sender is not concerned about being notified about bounced messages.

Parameters:

client a pointer to the network client to issue the MAIL FROM command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 196 of file relay.c.

References client_print(), client_read_line(), log_pedantic, st_char_get(), and st_length_int().

Referenced by smtp_bounce(), and smtp_reply().

5.118.1.7 int_t smtp_client_send_rcptto (client_t * client, stringer_t * rcptto)

Issue a RCPT TO command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the RCPT TO command.
rcptto a pointer to a managed string containing the recipient address parameter for the RCPT TO command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 219 of file relay.c.

References client_print(), client_read_line(), log_pedantic, st_char_get(), st_length_get(), and st_length_int().

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_send_message().

Log all relay key information to be returned via "magma -h".

5.119.1 Function Documentation

5.119.1.1 [relay_t* relay_alloc](#) (uint32_t [number](#))

Allocate and initialize a magma server relay object, or return it if it already exists.

Parameters:

number a zero-based index into the global relay server table where the entry should be created and/or queried.

Returns:

NULL on failure, or a pointer to the requested relay server object on success.

Definition at line 86 of file relay.c.

References [magma_t::host](#), [log_critical](#), [magma](#), [mm_alloc\(\)](#), [magma_t::relay](#), [relay_keys](#), and [relay_set_value\(\)](#).

Referenced by [relay_config\(\)](#).

5.119.1.2 [bool_t relay_config](#) ([stringer_t *name](#), [stringer_t *value](#))

Set the value of a relay server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new relay server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable relay server configuration parameter to be set.

value a managed string containing the new value of the relay server config key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 448 of file relay.c.

References bracket_extract_pl(), CONSTANT, log_critical, MAGMA_RELAY_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, relay_alloc(), relay_keys, relay_set_value(), st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.119.1.3 void relay_free (void)

Free magma's relay server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 39 of file relay.c.

References magma_t::host, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, mm_free(), relay_keys_t::norm, ns_empty(), ns_free(), relay_keys_t::offset, magma_t::relay, relay_keys, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.119.1.4 void relay_output_help (void)

Log all relay key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 508 of file relay.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, relay_keys_t::norm, relay_keys, relay_keys_t::required, and multi_t::val.

5.119.1.5 void relay_output_settings (void)

Definition at line 228 of file relay.c.

References magma_t::host, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(), relay_keys_t::offset, magma_t::relay, relay_keys, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.119.1.6 bool_t relay_set_value (relay_keys_t * *setting*, relay_t * *relay*, stringer_t * *value*)

Set a specified key for a relay server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

- setting* a pointer to the relay server configuration key to be set.
- relay* a pointer to the relay server configuration entry to be adjusted.
- value* a managed string containing the new value of the config key.

Returns:

true if the value was successfully set, or false on error.

Definition at line 303 of file relay.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, relay_keys_t::name, relay_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), relay_keys_t::offset, relay_counter(), multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by relay_alloc(), and relay_config().

5.119.1.7 bool_t relay_validate (void)

Validate all of the configured magma relay server instances. Iterates through all of the server structures and verifies that each was supplied with valid values for all of its required keys. This function also applies the application specific validation rules. Specifically it verifies that only one server structure has been configured to use a given port number.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all relay servers have been validated, or false on failure.

Definition at line 115 of file relay.c.

References magma_t::host, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(),

5.120.1 Function Documentation

5.120.1.1 `server_t* servers_alloc (uint32_t number)`

Allocate a new magma server configuration entry and initialize it to the default values. [servers.c](#)

Parameters:

number the index of the magma server instance in the global magma server array.

Returns:

NULL on failure, or a pointer to the requested magma server configuration entry on success.

Definition at line 193 of file `servers.c`.

References `log_critical`, `magma`, `mm_alloc()`, `server_t::network`, `server_keys`, `magma_t::servers`, `servers_set_value()`, and `server_t::sockd`.

Referenced by `servers_config()`.

5.120.1.2 `bool_t servers_config (stringer_t * name, stringer_t * value)`

Set the value of a magma server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new magma server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable magma server configuration parameter to be set.

value a managed string containing the new value of the magma server config key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 666 of file `servers.c`.

References `bracket_extract_pl()`, `CONSTANT`, `log_critical`, `MAGMA_SERVER_INSTANCES`, `NULLER`, `pl_char_get()`, `pl_empty()`, `pl_length_get()`, `PLACER`, `placer_t`, `server_keys`, `servers_alloc()`, `servers_set_value()`, `st_char_get()`, `st_cmp_ci_eq()`, `st_cmp_ci_starts()`, `st_length_get()`, `st_length_int()`, and `uint32_conv_bl()`.

Referenced by `config_load_cmdline_settings()`, `config_load_database_settings()`, and `config_load_file_settings()`.

5.120.1.3 `bool_t servers_encryption_start (void)`

Create a TLS context for each TLS enabled server instance.

Returns:

true on success or false on failure.

Definition at line 101 of file `servers.c`.

References `server_t::certificate`, `DMTP`, `server_t::enabled`, `magma`, `MAGMA_SERVER_INSTANCES`, `server_t::protocol`, `magma_t::servers`, `server_t::tls`, and `tls_server_create()`.

Referenced by `process_start()`.

5.120.1.4 void servers_encryption_stop (void)

Destroy the transport security context for each TLS enabled servers.

Returns:

This function returns no value.

Definition at line 132 of file servers.c.

References server_t::context, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, magma_t::servers, server_t::tls, and tls_server_destroy().

Referenced by process_stop().

5.120.1.5 void servers_free (void)

Free magma's server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 146 of file servers.c.

References log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, mm_free(), server_keys_t::norm, ns_empty(), ns_free(), server_keys_t::offset, server_keys, magma_t::servers, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.120.1.6 server_t* servers_get_by_protocol (uint32_t protocol, bool_t tls)

Lookup the server instance associated with a particular protocol type.

Note:

This function doesn't allow you to specify which server instance to return, if more than one is available.

Parameters:

protocol the enumerated protocol type being looked up.

tls whether the server instance should be a TCP server, or a TLS server instance.

Returns:

NULL if no server instances are configured, or a pointer to the server structure for a protocol.

Definition at line 54 of file servers.c.

References DMTP, server_t::enabled, HTTP, IMAP, log_pedantic, magma, MAGMA_SERVER_INSTANCES, MOLTEN, server_t::network, POP, server_t::protocol, magma_t::servers, SMTP, SUBMISSION, TCP_PORT, TLS_PORT, server_t::type, and type().

5.120.1.7 `server_t* servers_get_by_socket (int sockd)`

Lookup the server instance associated with a socket descriptor.

Parameters:

sockd the socket file descriptor to be looked up.

Returns:

NULL on failure, or a pointer to the server structure for the specified file descriptor on success.

Definition at line 34 of file servers.c.

References magma, MAGMA_SERVER_INSTANCES, server_t::network, magma_t::servers, and server_t::sockd.

5.120.1.8 `uint64_t servers_get_count_using_port (uint32_t port)`

Get the number of servers that are configured to use a specified port.

Parameters:

port the port number to be matched against the server list.

Returns:

the number of servers configured to use the port.

Definition at line 17 of file servers.c.

References count, magma, MAGMA_SERVER_INSTANCES, server_t::network, server_t::port, and magma_t::servers.

Referenced by net_trigger(), and servers_validate().

5.120.1.9 `bool_t servers_network_start (void)`

Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.

Note:

If any of the servers have an empty name or domain, the value of magma.host.name will be used instead.

Returns:

true if all server listening sockets were initialized successfully, or false on failure.

Definition at line 80 of file servers.c.

References server_t::domain, server_t::enabled, magma_t::host, magma, MAGMA_SERVER_INSTANCES, magma_t::name, server_t::name, net_init(), ns_length_get(), magma_t::servers, servers_network_stop(), st_empty, and st_import().

Referenced by process_start().

5.120.1.10 `void servers_network_stop (void)`

Close the listening sockets of all running servers.

Returns:

This function returns no value.

Definition at line 119 of file servers.c.

References `server_t::enabled`, `magma`, `MAGMA_SERVER_INSTANCES`, `net_shutdown()`, `server_t::network`, `magma_t::servers`, and `server_t::sockd`.

Referenced by `process_stop()`, and `servers_network_start()`.

5.120.1.11 void servers_output_help (void)

Log all server key information to be returned via the "magmad -h|--help" command.

Returns:

This function returns no value.

Definition at line 723 of file servers.c.

References `multi_t::bl`, `config_output_value_generic()`, `log_info`, `log_options`, `M_LOG_FILE_DISABLE`, `M_LOG_FUNCTION_DISABLE`, `M_LOG_LINE_DISABLE`, `M_LOG_LINE_FEED_DISABLE`, `M_LOG_STACK_TRACE_DISABLE`, `M_LOG_TIME_DISABLE`, `server_keys_t::norm`, `server_keys_t::required`, `server_keys`, and `multi_t::val`.

Referenced by `config_output_help()`.

5.120.1.12 void servers_output_settings (void)

Log the full contents of the magma server instance settings.

Returns:

This function returns no value.

Definition at line 368 of file servers.c.

References `CONSTANT`, `DMTP`, `GENERIC`, `HTTP`, `IMAP`, `log_info`, `log_pedantic`, `M_TYPE_BOOLEAN`, `M_TYPE_ENUM`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `magma`, `MAGMA_SERVER_INSTANCES`, `MOLTEN`, `server_keys_t::norm`, `ns_empty()`, `NULLER`, `server_keys_t::offset`, `POP`, `server_keys`, `magma_t::servers`, `SMTP`, `st_char_get()`, `st_cmp_cs_eq()`, `st_empty`, `st_length_int()`, `SUBMISSION`, `TCP_PORT`, `TLS_PORT`, `multi_t::type`, and `type()`.

Referenced by `config_output_settings()`.

5.120.1.13 bool_t servers_set_value (server_keys_t * setting, server_t * server, stringer_t * value)

Set the value of a key for a specified magma server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the magma server key to be set.

server a pointer to the magma server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 474 of file servers.c.

References `multi_t::binary`, `CONSTANT`, `CONTIGUOUS`, `DMTP`, `HEAP`, `HTTP`, `multi_t::i32`, `multi_t::i64`, `multi_t::i8`, `IMAP`, `int32_conv_st()`, `int64_conv_st()`, `int8_conv_st()`, `log_critical`, `M_TYPE_BOOLEAN`, `M_TYPE_ENUM`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `MANAGED_T`, `MOLTEN`, `server_keys_t::name`, `server_keys_t::norm`, `multi_t::ns`, `ns_dupe()`, `ns_empty()`, `ns_free()`, `ns_import()`, `NULLER`, `server_keys_t::offset`, `POP`, `SMTP`, `multi_t::st`, `st_char_get()`, `st_cmp_ci_eq()`, `st_dupe_opts()`, `st_empty`, `st_free()`, `st_length_get()`, `st_length_int()`, `SUBMISSION`, `TCP_PORT`, `TLS_PORT`, `type()`, `multi_t::type`, `multi_t::u16`, `multi_t::u32`, `multi_t::u64`, `multi_t::u8`, `uint16_conv_st()`, `uint32_conv_st()`, `uint64_conv_st()`, `uint8_conv_st()`, and `multi_t::val`.

Referenced by `servers_alloc()`, and `servers_config()`.

5.120.1.14 `bool_t servers_validate (void)`

Validate all of the configured magmad server instances.

Note:

This function also checks to see that no servers are binding to the same port.

Returns:

true if all servers have been validated, or false on failure.

Definition at line 220 of file servers.c.

Functions

- [server_t * servers_alloc](#) (uint32_t number)
[servers.c](#)
- [bool_t servers_config](#) (stringer_t *name, stringer_t *value)
Set the value of a magma server configuration entry by name.
- [bool_t servers_encryption_start](#) (void)
Create a TLS context for each TLS enabled server instance.
- [void servers_encryption_stop](#) (void)
Destroy the transport security context for each TLS enabled servers.
- [void servers_free](#) (void)
Free magma's server configuration options.
- [server_t * servers_get_by_protocol](#) (uint32_t protocol, bool_t tls)
Lookup the server instance associated with a particular protocol type.
- [server_t * servers_get_by_socket](#) (int sockd)
Lookup the server instance associated with a socket descriptor.
- [uint64_t servers_get_count_using_port](#) (uint32_t port)
Get the number of servers that are configured to use a specified port.
- [bool_t servers_network_start](#) (void)
Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.
- [void servers_network_stop](#) (void)
Close the listening sockets of all running servers.
- [void servers_output_help](#) (void)
Log all server key information to be returned via the "magmad -h|--help" command.
- [void servers_output_settings](#) (void)
Log the full contents of the magma server instance settings.

- [bool_t servers_set_value](#) ([server_keys_t](#) *setting, [server_t](#) *server, [stringer_t](#) *value)

Set the value of a key for a specified magma server configuration entry.

- [bool_t servers_validate](#) (void)

Validate all of the configured magmad server instances.

5.121.1 Enumeration Type Documentation

5.121.1.1 enum M_PORT

Enumerator:

TCP_PORT

TLS_PORT

Definition at line 11 of file servers.h.

5.121.1.2 enum M_PROTOCOL

Enumerator:

GENERIC

MOLTEN

HTTP

POP

IMAP

SMTP

DMTP

SUBMISSION

Definition at line 16 of file servers.h.

5.121.2 Function Documentation

5.121.2.1 server_t* servers_alloc (uint32_t number)

[servers.c](#) [servers.c](#)

Parameters:

number the index of the magma server instance in the global magma server array.

Returns:

NULL on failure, or a pointer to the requested magma server configuration entry on success.

Definition at line 193 of file servers.c.

References [log_critical](#), [magma](#), [mm_alloc\(\)](#), [server_t::network](#), [server_keys](#), [magma_t::servers](#), [servers_set_value\(\)](#), and [server_t::sockd](#).

Referenced by [servers_config\(\)](#).

5.121.2.2 **bool_t servers_config (stringer_t * name, stringer_t * value)**

Set the value of a magma server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new magma server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable magma server configuration parameter to be set.

value a managed string containing the new value of the magma server config key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 666 of file servers.c.

References bracket_extract_pl(), CONSTANT, log_critical, MAGMA_SERVER_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, server_keys, servers_alloc(), servers_set_value(), st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.121.2.3 **bool_t servers_encryption_start (void)**

Create a TLS context for each TLS enabled server instance.

Returns:

true on success or false on failure.

Definition at line 101 of file servers.c.

References server_t::certificate, DMTP, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, server_t::protocol, magma_t::servers, server_t::tls, and tls_server_create().

Referenced by process_start().

5.121.2.4 **void servers_encryption_stop (void)**

Destroy the transport security context for each TLS enabled servers.

Returns:

This function returns no value.

Definition at line 132 of file servers.c.

References server_t::context, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, magma_t::servers, server_t::tls, and tls_server_destroy().

Referenced by process_stop().

5.121.2.5 **void servers_free (void)**

Free magma's server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 146 of file servers.c.

References log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, mm_free(), server_keys_t::norm, ns_empty(), ns_free(), server_keys_t::offset, server_keys, magma_t::servers, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.121.2.6 server_t* servers_get_by_protocol (uint32_t protocol, bool_t tls)

Lookup the server instance associated with a particular protocol type.

Note:

This function doesn't allow you to specify which server instance to return, if more than one is available.

Parameters:

protocol the enumerated protocol type being looked up.

tls whether the server instance should be a TCP server, or a TLS server instance.

Returns:

NULL if no server instances are configured, or a pointer to the server structure for a protocol.

Definition at line 54 of file servers.c.

References DMTP, server_t::enabled, HTTP, IMAP, log_pedantic, magma, MAGMA_SERVER_INSTANCES, MOLTEN, server_t::network, POP, server_t::protocol, magma_t::servers, SMTP, SUBMISSION, TCP_PORT, TLS_PORT, server_t::type, and type().

5.121.2.7 server_t* servers_get_by_socket (int sockd)

Lookup the server instance associated with a socket descriptor.

Parameters:

sockd the socket file descriptor to be looked up.

Returns:

NULL on failure, or a pointer to the server structure for the specified file descriptor on success.

Definition at line 34 of file servers.c.

References magma, MAGMA_SERVER_INSTANCES, server_t::network, magma_t::servers, and server_t::sockd.

5.121.2.8 uint64_t servers_get_count_using_port (uint32_t port)

Get the number of servers that are configured to use a specified port.

Parameters:

port the port number to be matched against the server list.

Returns:

the number of servers configured to use the port.

Definition at line 17 of file servers.c.

References count, magma, MAGMA_SERVER_INSTANCES, server_t::network, server_t::port, and magma_t::servers.

Referenced by net_trigger(), and servers_validate().

5.121.2.9 bool_t servers_network_start (void)

Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.

Note:

If any of the servers have an empty name or domain, the value of magma.host.name will be used instead.

Returns:

true if all server listening sockets were initialized successfully, or false on failure.

Definition at line 80 of file servers.c.

References server_t::domain, server_t::enabled, magma_t::host, magma, MAGMA_SERVER_INSTANCES, magma_t::name, server_t::name, net_init(), ns_length_get(), magma_t::servers, servers_network_stop(), st_empty, and st_import().

Referenced by process_start().

5.121.2.10 void servers_network_stop (void)

Close the listening sockets of all running servers.

Returns:

This function returns no value.

Definition at line 119 of file servers.c.

References server_t::enabled, magma, MAGMA_SERVER_INSTANCES, net_shutdown(), server_t::network, magma_t::servers, and server_t::sockd.

Referenced by process_stop(), and servers_network_start().

5.121.2.11 void servers_output_help (void)

Log all server key information to be returned via the "magmad -h|--help" command.

Returns:

This function returns no value.

Definition at line 723 of file servers.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, server_keys_t::norm, server_keys_t::required, server_keys, and multi_t::val.

Referenced by config_output_help().

5.121.2.12 void servers_output_settings (void)

Log the full contents of the magma server instance settings.

Returns:

This function returns no value.

Definition at line 368 of file servers.c.

References `CONSTANT`, `DMTP`, `GENERIC`, `HTTP`, `IMAP`, `log_info`, `log_pedantic`, `M_TYPE_BOOLEAN`, `M_TYPE_ENUM`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `magma`, `MAGMA_SERVER_INSTANCES`, `MOLTEN`, `server_keys_t::norm`, `ns_empty()`, `NULLER`, `server_keys_t::offset`, `POP`, `server_keys`, `magma_t::servers`, `SMTP`, `st_char_get()`, `st_cmp_cs_eq()`, `st_empty`, `st_length_int()`, `SUBMISSION`, `TCP_PORT`, `TLS_PORT`, `multi_t::type`, and `type()`.

Referenced by `config_output_settings()`.

5.121.2.13 bool_t servers_set_value (server_keys_t * setting, server_t * server, stringer_t * value)

Set the value of a key for a specified magma server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the magma server key to be set.

server a pointer to the magma server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was successfully set, or false on failure.

Definition at line 474 of file servers.c.

References `multi_t::binary`, `CONSTANT`, `CONTIGUOUS`, `DMTP`, `HEAP`, `HTTP`, `multi_t::i32`, `multi_t::i64`, `multi_t::i8`, `IMAP`, `int32_conv_st()`, `int64_conv_st()`, `int8_conv_st()`, `log_critical`, `M_TYPE_BOOLEAN`, `M_TYPE_ENUM`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `MANAGED_T`, `MOLTEN`, `server_keys_t::name`, `server_keys_t::norm`, `multi_t::ns`, `ns_dupe()`, `ns_empty()`, `ns_free()`, `ns_import()`, `NULLER`, `server_keys_t::offset`, `POP`, `SMTP`, `multi_t::st`, `st_char_get()`, `st_cmp_ci_eq()`, `st_dupe_opts()`, `st_empty`, `st_free()`, `st_length_get()`, `st_length_int()`, `SUBMISSION`, `TCP_PORT`, `TLS_PORT`, `type()`, `multi_t::type`, `multi_t::u16`, `multi_t::u32`, `multi_t::u64`, `multi_t::u8`, `uint16_conv_st()`, `uint32_conv_st()`, `uint64_conv_st()`, `uint8_conv_st()`, and `multi_t::val`.

Referenced by `servers_alloc()`, and `servers_config()`.

5.121.2.14 bool_t servers_validate (void)

Validate all of the configured magmad server instances.

Note:

This function also checks to see that no servers are binding to the same port.

Returns:

true if all servers have been validated, or false on failure.

Definition at line 220 of file servers.c.

References `buflen`, `bufptr`, `server_t::certificate`, `CONSTANT`, `DMTP`, `file_readwritable()`, `file_world_accessible()`, `GENERIC`, `multi_t::i16`, `multi_t::i32`, `multi_t::i64`, `multi_t::i8`, `log_critical`, `log_pedantic`, `M_TYPE_BOOLEAN`, `M_TYPE_ENUM`, `M_TYPE_INT16`, `M_TYPE_INT32`, `M_TYPE_INT64`, `M_TYPE_INT8`, `M_TYPE_NULLER`, `M_TYPE_STRINGER`, `M_TYPE_UINT16`, `M_TYPE_UINT32`, `M_TYPE_UINT64`, `M_TYPE_UINT8`, `magma`, `MAGMA_SERVER_INSTANCES`, `server_t::network`, `server_keys_t::norm`, `ns_empty()`, `NULLER`, `server_keys_t::offset`, `server_t::port`, `server_t::protocol`, `server_keys`, `magma_t::servers`, `servers_get_count_using_port()`, `st_cmp_ci_eq()`, `st_empty`, `server_t::tls`, `TLS_PORT`, `multi_t::type`, `type()`, `server_t::type`, `multi_t::u16`, `multi_t::u32`, `multi_t::u64`, `multi_t::u8`, and `multi_t::val`.

Functions

- void `display_usage` (void)
args.c
- `bool_t` `args_parse` (int argc, char *argv[])
Process any command line arguments supplied to magma.
- `bool_t` `sanity_check` (void)
Perform a series of system-wide sanity checks at process startup.
- void `process_stop` (void)
Execute the magma shutdown routines.
- `bool_t` `process_start` (void)
Execute the magma initializations routines, making sure they all run properly.
- `bool_t` `signal_start` (void)
signal.c
- `bool_t` `signal_thread_start` (void)
Bind a SIGALRM handler for the calling thread.
- void `signal_segfault` (int signal)
Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).
- void `signal_shutdown` (int signal)
A function to handle receipt of shutdown signals and allow for graceful exits.
- void `signal_status` (int signal)
A generic worker thread signal handler entry point.
- `bool_t` `system_change_root_directory` (void)
system.c
- `bool_t` `system_fork_daemon` (void)
Daemonize into the background, if the magma.system.daemonize config option is set.
- `bool_t` `system_init_core_dumps` (void)
Set the magma core dump size rlimit, if magma.system.enable_core_dumps was enabled.
- `bool_t` `system_init_impersonation` (void)
Set process privileges to run as a specified user if magma.system.impersonate_user is set.
- `bool_t` `system_init_resource_limits` (void)
Increase process resource limits, if magma.system.increase_resource_limits is set.
- `bool_t` `system_init_umask` (void)
Set the process umask for new file/dir creation to O_RDWR.
- `uint64_t` `system_ulimit_cur` (`int_t` resource)

Get the soft system limit for a specified resource.

- `uint64_t system_ulimit_max (int_t resource)`

Get the hard system limit for a specified resource.

- `bool_t thread_start (void)`

thread.c

- `void thread_stop (void)`

Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

5.124.1 Function Documentation

5.124.1.1 `bool_t args_parse (int argc, char * argv[])`

Process any command line arguments supplied to magma.

Note:

A few command line options are supported: `-h` (`--help`), `-d` (`--dump`), `-v` (`--version`), and `-c` (`--config`). Otherwise, the magma config file path will be loaded from the command line. If not an option starting with "-", the final command line argument is assumed to be the path of the magma configuration file.

Returns:

true if the command line arguments were parsed successfully, or false if there was an error.

Definition at line 39 of file `args.c`.

References `build_commit()`, `build_stamp()`, `build_version()`, `cmdline_config_data`, `magma_t::config`, `config_load_defaults()`, `config_output_help()`, `display_usage()`, `exit_and_dump`, `magma_t::file`, `HEAP`, `JOINTED`, `log_critical`, `log_info`, `magma`, `MAGMA_FILEPATH_MAX`, `MANAGED_T`, `mm_cmp_cs_eq()`, `NULLER`, `PLACER`, `st_append`, `st_cmp_cs_eq()`, and `st_dupe_opts()`.

Referenced by `main()`.

5.124.1.2 `void display_usage (void)`

`args.c` `args.c`

Returns:

This function returns no value.

Definition at line 19 of file `args.c`.

References `log_info`.

Referenced by `args_parse()`.

5.124.1.3 `bool_t process_start (void)`

Execute the magma initializations routines, making sure they all run properly.

Note:

If any of the init routines returns with failure, this function fails and logs an error message. Certain checks are made that the init routines are run in a particular order, especially in waiting for daemonization and privilege dropping before starting logging. The system maintenance thread is also launched from here.

Returns:

true if all starter functions returned true, or false if any of them failed..

Definition at line 163 of file process.c.

References `cache_start()`, `config_load_cmdline_settings()`, `config_load_database_settings()`, `config_load_defaults()`, `config_load_file_settings()`, `config_validate_settings()`, `deprecated_ecies_start()`, `dkim_start()`, `dspam_start()`, `exit_and_dump`, `magma_t::host`, `http_content_start()`, `magma_t::init`, `lib_load()`, `log_critical`, `log_options`, `log_start()`, `M_LOG_FILE_DISABLE`, `M_LOG_FUNCTION_DISABLE`, `M_LOG_INFO`, `M_LOG_LINE_DISABLE`, `M_LOG_STACK_TRACE_DISABLE`, `M_LOG_TIME_DISABLE`, `magma`, `MAGMA_HOSTNAME_MAX`, `mail_cache_start()`, `maint`, `mm_alloc()`, `mm_free()`, `mm_sec_start()`, `magma_t::name`, `obj_cache_start()`, `magma_t::page_length`, `prime_start()`, `process_maint()`, `protocol_init()`, `queue_init()`, `rand_start()`, `sanity_check()`, `servers_encryption_start()`, `servers_network_start()`, `signal_start()`, `spf_start()`, `spool_start()`, `sql_start()`, `ssl_start()`, `stats_init()`, `status_process()`, `system_change_root_directory()`, `system_fork_daemon()`, `system_init_core_dumps()`, `system_init_impersonation()`, `system_init_resource_limits()`, `system_init_umask()`, `tank_start()`, `thread_launch()`, `virus_start()`, `warehouse_start()`, and `xml_start()`.

Referenced by `main()`.

5.124.1.4 void process_stop (void)

Execute the magma shutdown routines.

Note:

This function will execute a shutdown routine for each of the startup initialization routines that was performed. It will also signal and terminate the maintenance thread.

Returns:

This function returns no value.

Definition at line 66 of file process.c.

References `cache_stop()`, `config_free()`, `deprecated_ecies_stop()`, `dkim_stop()`, `dspam_stop()`, `http_content_stop()`, `magma_t::init`, `lib_unload()`, `log_critical`, `log_info`, `log_options`, `log_pedantic`, `M_LOG_FILE_DISABLE`, `M_LOG_FUNCTION_DISABLE`, `M_LOG_INFO`, `M_LOG_LINE_DISABLE`, `M_LOG_STACK_TRACE_DISABLE`, `M_LOG_TIME_DISABLE`, `magma`, `mail_cache_stop()`, `maint`, `mm_free()`, `mm_sec_stop()`, `obj_cache_stop()`, `prime_stop()`, `queue_shutdown()`, `rand_stop()`, `servers_encryption_stop()`, `servers_network_stop()`, `spf_stop()`, `spool_stop()`, `sql_stop()`, `ssl_stop()`, `stats_shutdown()`, `status`, `tank_stop()`, `thread_join()`, `thread_signal()`, `virus_stop()`, `warehouse_stop()`, and `xml_stop()`.

Referenced by `main()`.

5.124.1.5 bool_t sanity_check (void)

Perform a series of system-wide sanity checks at process startup.

Note:

This function ensures that the standard data types are their expected data sizes, and performs other checks, such as data primitive maximum values.

Returns:

true if the system environment passed all checks and should function correctly, or false if any checks failed.

Definition at line 15 of file sanity.c.

References `CONSTANT`, `MAGMA_CORE_POOL_OBJECTS_LIMIT`, `MAGMA_CORE_POOL_TIMEOUT_LIMIT`, `NULLER`, `placer_t`, `queries`, `record_t`, `SELECT_DOMAINS`, `st_alloc()`, `st_avail_get()`, `st_cmp_cs_eq()`, `st_data_get()`, and `st_free()`.

Referenced by `process_start()`.

5.124.1.6 void signal_segfault (int *signal*)

Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).

Note:

The signals handled by this function are: SIGSEGV, SIGFPE, SIGBUS, SIGSYS, and SIGABRT. The handler will respond by logging a stack backtrace, and terminating the program with abort().

Parameters:

signal the number of the signal that was received.

Returns:

This function returns no value.

Definition at line 19 of file signal.c.

References log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, mm_wipe(), and signal_name().

Referenced by signal_start().

5.124.1.7 void signal_shutdown (int *signal*)

A function to handle receipt of shutdown signals and allow for graceful exits.

Note:

This function handles the following signals: SIGINT, SIGQUIT, and SIGTERM. The shutdown procedure is as follows: 1. Set status to -1 and sleep for .1 second to allow for normal daemon termination. 2. Signal all worker threads to wake up blocked threads, and sleep one more second. 3. Loop through all possible file descriptors and if the descriptor matches a socket that is bound to a magma server, close it.

Parameters:

signal the number of the signal delivered to the process.

Returns:

This function returns no value.

Definition at line 52 of file signal.c.

References log_critical, MEMORYBUF, mm_wipe(), net_trigger(), queue_signal(), signal_name(), status_signal(), thread_join(), and thread_launch().

Referenced by signal_start().

5.124.1.8 bool_t signal_start (void)

[signal.c](#) [signal.c](#)

Note:

The following handlers are established: signal_shutdown: SIGINT, SIGQUIT, SIGTERM, SIGHUP signal_segfault: SIGSEGV, SIGFPE, SIGBUS, SIGSYS signal_refresh: SIGHUP [ignored]: SIGPIPE

Returns:

true if all signal handlers were successfully registered, or false on failure.

Definition at line 154 of file signal.c.

References log_info, mm_wipe(), signal_refresh(), signal_segfault(), and signal_shutdown().

Referenced by process_start().

5.124.1.9 void signal_status (int *signal*)

A generic worker thread signal handler entry point.

Note:

If the target thread is not in the process of shutting down, display the name of the caught signal.

Parameters:

signal the number of the signal caught by the signal handler.

Returns:

This function returns no value.

Definition at line 93 of file signal.c.

References log_info, signal_name(), and status.

Referenced by signal_thread_start().

5.124.1.10 bool_t signal_thread_start (void)

Bind a SIGALRM handler for the calling thread.

See also:

[signal_status\(\)](#)

Returns:

false on failure or true on success.

TODO: Disabling this signal handler to see if it fixes the shutdown issue.

Definition at line 128 of file signal.c.

References log_info, mm_wipe(), and signal_status().

Referenced by thread_start().

5.124.1.11 bool_t system_change_root_directory (void)

[system.c](#) [system.c](#)

Returns:

true on success or false on failure.

Definition at line 66 of file system.c.

References buflen, bufptr, log_info, magma, magma_t::root_directory, and magma_t::system.

Referenced by process_start().

5.124.1.12 `bool_t system_fork_daemon (void)`

Daemonize into the background, if the `magma.system.daemonize` config option is set.

Returns:

true inside the child process, or false inside the parent process or if an error occurs.

Definition at line 81 of file `system.c`.

References `magma_t::daemonize`, `log_critical`, `log_info`, `magma`, `pid`, `status_process()`, and `magma_t::system`.

Referenced by `process_start()`.

5.124.1.13 `bool_t system_init_core_dumps (void)`

Set the magma core dump size `rlimit`, if `magma.system.enable_core_dumps` was enabled.

Returns:

true if core dumps were successfully enabled or false on failure.

Definition at line 149 of file `system.c`.

References `buflen`, `bufptr`, `magma_t::core_dump_size_limit`, `magma_t::enable_core_dumps`, `log_info`, `magma`, and `magma_t::system`.

Referenced by `process_start()`.

5.124.1.14 `bool_t system_init_impersonation (void)`

Set process privileges to run as a specified user if `magma.system.impersonate_user` is set.

Note:

This function will set the user id and group id to the specified user, and `chdir()` to their home directory.

Returns:

true on success or if `magma.system.impersonate_user` is not set; false on failure to change privileges.

Definition at line 169 of file `system.c`.

References `buflen`, `bufptr`, `magma_t::impersonate_user`, `log_critical`, `log_info`, `magma`, `mm_alloc()`, `mm_free()`, `mm_wipe()`, `status_process()`, and `magma_t::system`.

Referenced by `process_start()`.

5.124.1.15 `bool_t system_init_resource_limits (void)`

Increase process resource limits, if `magma.system.increase_resource_limits` is set.

Note:

Resource limits will be maximized for magma's virtual address space, data and stack segments, available file descriptors and sub-processes, and allowed file sizes. If `output_resource_limits` is enabled, the state of the process resource limits will be dumped to the log afterwards.

Returns:

This function always returns true (errors are logged).

Definition at line 244 of file system.c.

References magma_t::config, magma_t::increase_resource_limits, log_info, magma, MEMORYBUF, magma_t::output_resource_limits, and magma_t::system.

Referenced by process_start().

5.124.1.16 bool_t system_init_umask (void)

Set the process umask for new file/dir creation to O_RDWR.

Returns:

true if the umask was set successfully, or false on failure.

Definition at line 131 of file system.c.

References buflen, bufptr, and log_info.

Referenced by process_start().

5.124.1.17 uint64_t system_ulimit_cur (int_t resource)

Get the soft system limit for a specified resource.

Note:

This function will never return a value greater than UINT64_MAX.

See also:

getrlimit64()

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system soft limit of the specified resource identifier on success.

Definition at line 43 of file system.c.

References buflen, bufptr, log_info, and log_pedantic.

Referenced by st_realloc().

5.124.1.18 uint64_t system_ulimit_max (int_t resource)

Get the hard system limit for a specified resource.

Note:

This function will never return a value greater than UINT64_MAX.

See also:

getrlimit64()

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system hard limit of the specified resource identifier on success.

Definition at line 17 of file system.c.

References buflen, bufptr, log_info, and log_pedantic.

Referenced by config_validate_settings().

5.124.1.19 bool_t thread_start (void)

thread.c thread.c

Returns:

true on success or false on failure.

Definition at line 27 of file thread.c.

References signal_thread_start(), and sql_thread_start().

Referenced by dequeue(), net_accept(), and process_maint().

5.124.1.20 void thread_stop (void)

Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

Returns:

This function returns no value.

Definition at line 14 of file thread.c.

References mail_cache_thread_stop(), sql_thread_stop(), and ssl_thread_stop().

Referenced by dequeue(), net_accept(), and process_maint().

5.126.1 Function Documentation

5.126.1.1 void [signal_refresh](#) (int *signal*)

A function to handle receipt of SIGHUP and refresh all web server content.

Parameters:

signal the number of the delivered signal (should only be SIGHUP).

Returns:

This function returns no value.

Definition at line 107 of file signal.c.

References [http_content_refresh\(\)](#), [log_error](#), [log_info](#), [mutex_lock\(\)](#), [mutex_unlock\(\)](#), and [sig_hup_mutex](#).

Referenced by [signal_start\(\)](#).

5.126.1.2 void [signal_segfault](#) (int *signal*)

Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).

Note:

The signals handled by this function are: SIGSEGV, SIGFPE, SIGBUS, SIGSYS, and SIGABRT. The handler will respond by logging a stack backtrace, and terminating the program with abort().

Parameters:

signal the number of the signal that was received.

Returns:

This function returns no value.

Definition at line 19 of file signal.c.

References log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, mm_wipe(), and signal_name().

Referenced by signal_start().

5.126.1.3 void signal_shutdown (int *signal*)

A function to handle receipt of shutdown signals and allow for graceful exits.

Note:

This function handles the following signals: SIGINT, SIGQUIT, and SIGTERM. The shutdown procedure is as follows: 1. Set status to -1 and sleep for .1 second to allow for normal daemon termination. 2. Signal all worker threads to wake up blocked threads, and sleep one more second. 3. Loop through all possible file descriptors and if the descriptor matches a socket that is bound to a magma server, close it.

Parameters:

signal the number of the signal delivered to the process.

Returns:

This function returns no value.

Definition at line 52 of file signal.c.

References log_critical, MEMORYBUF, mm_wipe(), net_trigger(), queue_signal(), signal_name(), status_signal(), thread_join(), and thread_launch().

Referenced by signal_start().

5.126.1.4 bool_t signal_start (void)

Setup signal masks and register signal handlers for handling shutdowns, program termination, and reloads. [signal.c](#)

Note:

The following handlers are established: signal_shutdown: SIGINT, SIGQUIT, SIGTERM, SIGHUP signal_segfault: SIGSEGV, SIGFPE, SIGBUS, SIGSYS signal_refresh: SIGHUP [ignored]: SIGPIPE

Returns:

true if all signal handlers were successfully registered, or false on failure.

Definition at line 154 of file signal.c.

References log_info, mm_wipe(), signal_refresh(), signal_segfault(), and signal_shutdown().

Referenced by process_start().

5.126.1.5 void signal_status (int *signal*)

A generic worker thread signal handler entry point.

Note:

If the target thread is not in the process of shutting down, display the name of the caught signal.

Parameters:

signal the number of the signal caught by the signal handler.

Returns:

This function returns no value.

Definition at line 93 of file signal.c.

References log_info, signal_name(), and status.

Referenced by signal_thread_start().

5.126.1.6 bool_t signal_thread_start (void)

Bind a SIGALRM handler for the calling thread.

See also:

[signal_status\(\)](#)

Returns:

false on failure or true on success.

TODO: Disabling this signal handler to see if it fixes the shutdown issue.

Definition at line 128 of file signal.c.

References log_info, mm_wipe(), and signal_status().

Referenced by thread_start().

5.126.2 Variable Documentation

Set process privileges to run as a specified user if magma.system.impersonate_user is set.
- [bool_t system_init_resource_limits \(void\)](#)
Increase process resource limits, if magma.system.increase_resource_limits is set.

5.127.1 Function Documentation

5.127.1.1 bool_t system_change_root_directory (void)

Perform a chroot() on the directory specified in the config option magma.system.root_directory, if it is set. [system.c](#)

Returns:

true on success or false on failure.

Definition at line 66 of file system.c.

References [buflen](#), [bufptr](#), [log_info](#), [magma](#), [magma_t::root_directory](#), and [magma_t::system](#).

Referenced by [process_start\(\)](#).

5.127.1.2 bool_t system_fork_daemon (void)

Daemonize into the background, if the magma.system.daemonize config option is set.

Returns:

true inside the child process, or false inside the parent process or if an error occurs.

Definition at line 81 of file system.c.

References magma_t::daemonize, log_critical, log_info, magma, pid, status_process(), and magma_t::system.

Referenced by process_start().

5.127.1.3 bool_t system_init_core_dumps (void)

Set the magma core dump size rlimit, if magma.system.enable_core_dumps was enabled.

Returns:

true if core dumps were successfully enabled or false on failure.

Definition at line 149 of file system.c.

References buflen, bufptr, magma_t::core_dump_size_limit, magma_t::enable_core_dumps, log_info, magma, and magma_t::system.

Referenced by process_start().

5.127.1.4 bool_t system_init_impersonation (void)

Set process privileges to run as a specified user if magma.system.impersonate_user is set.

Note:

This function will set the user id and group id to the specified user, and chdir() to their home directory.

Returns:

true on success or if magma.system.impersonate_user is not set; false on failure to change privileges.

Definition at line 169 of file system.c.

References buflen, bufptr, magma_t::impersonate_user, log_critical, log_info, magma, mm_alloc(), mm_free(), mm_wipe(), status_process(), and magma_t::system.

Referenced by process_start().

5.127.1.5 bool_t system_init_resource_limits (void)

Increase process resource limits, if magma.system.increase_resource_limits is set.

Note:

Resource limits will be maximized for magma's virtual address space, data and stack segments, available file descriptors and sub-processes, and allowed file sizes. If output_resource_limits is enabled, the state of the process resource limits will be dumped to the log afterwards.

Returns:

This function always returns true (errors are logged).

Definition at line 244 of file system.c.

References magma_t::config, magma_t::increase_resource_limits, log_info, magma, MEMORYBUF, magma_t::output_resource_limits, and magma_t::system.

Referenced by process_start().

5.127.1.6 `bool_t system_init_umask (void)`

Set the process umask for new file/dir creation to O_RDWR.

Returns:

true if the umask was set successfully, or false on failure.

Definition at line 131 of file system.c.

References `buflen`, `bufptr`, and `log_info`.

Referenced by `process_start()`.

5.127.1.7 `uint64_t system_ulimit_cur (int_t resource)`

Get the soft system limit for a specified resource.

Note:

This function will never return a value greater than `UINT64_MAX`.

See also:

`getrlimit64()`

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system soft limit of the specified resource identifier on success.

Definition at line 43 of file system.c.

References `buflen`, `bufptr`, `log_info`, and `log_pedantic`.

Referenced by `st_realloc()`.

5.127.1.8 `uint64_t system_ulimit_max (int_t resource)`

Get the hard system limit for a specified resource.

Note:

This function will never return a value greater than `UINT64_MAX`.

See also:

`getrlimit64()`

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system hard limit of the specified resource identifier on success.

Definition at line 17 of file system.c.

References `buflen`, `bufptr`, `log_info`, and `log_pedantic`.

Referenced by `config_validate_settings()`.

Functions

- void [dequeue](#) (void)
queue.c
- void [enqueue](#) (void *function, void *data)
Push a function on the job queue to be executed asynchronously.
- [bool_t](#) [queue_init](#) (void)
Create a queue of worker threads and set them into motion.
- void [queue_shutdown](#) (void)
Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.
- void [queue_signal](#) (void)
Signal all worker threads with SIGALRM to force their return.
- void [requeue](#) (void *function, void *requeue, void *data)
Push a function on the job queue to be executed asynchronously.
- [bool_t](#) [protocol_init](#) (void)
protocol.c
- void [protocol_process](#) ([server_t](#) *server, int sockd)
Create a connection object for an accepted connection, and enqueue it to be handled.

5.128.1 Function Documentation

5.128.1.1 void dequeue (void)

[queue.c](#) [queue.c](#)

Note:

This is the thread pool entry point called from [queue_init\(\)](#).

Returns:

This function returns no value.

Definition at line 79 of file [queue.c](#).

References [queue_t::data](#), [queue_t::function](#), [log_error](#), [mm_free\(\)](#), [mutex_lock\(\)](#), [mutex_unlock\(\)](#), [queue_t::next](#), [queue](#), [queue_t::requeue\(\)](#), [stats_decrement_by_name\(\)](#), [stats_increment_by_name\(\)](#), [status](#), [thread_start\(\)](#), and [thread_stop\(\)](#).

Referenced by [queue_init\(\)](#).

5.128.1.2 void enqueue (void *function, void *data)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new [queue_t](#) object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

data a pointer to an arbitrary block of data to be passed to the specified function on execution.

Returns:

This function returns no value.

Definition at line 69 of file queue.c.

References [requeue\(\)](#).

Referenced by [con_reverse_enqueue\(\)](#), [dmtplib_process\(\)](#), [dmtplib_requeue\(\)](#), [http_process\(\)](#), [http_requeue\(\)](#), [imap_process\(\)](#), [imap_requeue\(\)](#), [molten_init\(\)](#), [molten_invalid\(\)](#), [molten_parse\(\)](#), [molten_stats\(\)](#), [pop_process\(\)](#), [pop_requeue\(\)](#), [protocol_enqueue\(\)](#), [protocol_process\(\)](#), [smtp_process\(\)](#), and [smtp_requeue\(\)](#).

5.128.1.3 bool_t protocol_init (void)

[protocol.c](#) [protocol.c](#)

Returns:

This function always returns true.

Definition at line 86 of file protocol.c.

References [dmtplib_sort\(\)](#), [imap_sort\(\)](#), [molten_sort\(\)](#), [pop_sort\(\)](#), [portal_endpoint_sort\(\)](#), and [smtp_sort\(\)](#).

Referenced by [process_start\(\)](#).

5.128.1.4 void protocol_process (server_t * server, int sockd)

Create a connection object for an accepted connection, and enqueue it to be handled.

See also:

[protocol_secure\(\)](#), [protocol_enqueue\(\)](#)

Note:

Depending on whether the server specifies a secure transport layer, [protocol_secure\(\)](#) or [protocol_enqueue\(\)](#) will be dispatched.

Parameters:

server a pointer to the server object of the server handling the connection.

sockd the socket descriptor of the newly accepted connection.

Definition at line 201 of file protocol.c.

References [con_init\(\)](#), [connection_t](#), [server_t::context](#), [enqueue\(\)](#), [log_pedantic\(\)](#), [net_set_timeout\(\)](#), [server_t::network](#), [protocol_enqueue\(\)](#), [protocol_secure\(\)](#), [server_t::timeout](#), [server_t::tls](#), [TLS_PORT](#), and [server_t::type](#).

Referenced by [net_accept\(\)](#).

5.128.1.5 bool_t queue_init (void)

Create a queue of worker threads and set them into motion.

Note:

Up to magma.system.worker_threads number of threads will be created.

Returns:

false on failure or true on success.

Definition at line 154 of file queue.c.

References dequeue(), log_error, magma, mm_alloc(), mutex_init(), queue, queue_shutdown(), stats_increment_by_name(), magma_t::system, thread_launch(), and magma_t::worker_threads.

Referenced by process_start().

5.128.1.6 void queue_shutdown (void)

Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.

Returns:

This function returns no value.

Definition at line 188 of file queue.c.

References magma, mm_cleanup, mutex_destroy(), queue, stats_decrement_by_name(), magma_t::system, thread_join(), and magma_t::worker_threads.

Referenced by process_stop(), and queue_init().

5.128.1.7 void queue_signal (void)

Signal all worker threads with SIGALRM to force their return.

Returns:

This function returns no value.

Definition at line 133 of file queue.c.

References log_info, magma, queue, status, magma_t::system, thread_signal(), and magma_t::worker_threads.

Referenced by net_trigger(), and signal_shutdown().

5.128.1.8 void requeue (void *function, void *requeue, void *data)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new [queue_t](#) object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

requeue an optional pointer to a requeue function to be called after function is executed.

data a pointer to an arbitrary block of data to be passed to function and/or requeue upon execution.

Returns:

This function returns no value.

Definition at line 33 of file queue.c.

References `queue_t::data`, `queue_t::function`, `log_critical`, `mm_alloc()`, `mutex_lock()`, `mutex_unlock()`, `queue_t::next`, `queue`, and `queue_t::requeue()`.

Referenced by `dmtplib_process()`, `enqueue()`, `http_process()`, `http_requeue()`, `imap_process()`, `pop_process()`, `sess_release()`, `smtp_data()`, and `smtp_process()`.

5.129 src/engine/controller/protocol.c File Reference

```
#include "magma.h"
```

Functions

- [stringer_t * protocol_type](#) ([connection_t *con](#))
- [bool_t protocol_init](#) (void)
Initialize all protocol modules, and prime their command arrays for binary searching.
- void [protocol_enqueue](#) ([connection_t *con](#))
Enqueue a protocol-specific handler to service a specified connection, and update any statistics accordingly.
- void [protocol_secure](#) ([connection_t *con](#))
Establish a secure channel for an inbound TLS connection before passing it off to the general server request handler.
- void [protocol_process](#) ([server_t *server](#), int sockd)
Create a connection object for an accepted connection, and enqueue it to be handled.

5.129.1 Function Documentation

5.129.1.1 void protocol_enqueue (connection_t * con)

Enqueue a protocol-specific handler to service a specified connection, and update any statistics accordingly.

Note:

If an invalid protocol is specified, the connection will be destroyed gracefully.

Parameters:

con a pointer to the connection object to be serviced.

Returns:

This function returns no value.

Definition at line 102 of file protocol.c.

References [con_destroy\(\)](#), [con_secure\(\)](#), [DMTP](#), [dmtplib_init\(\)](#), [enqueue\(\)](#), [HTTP](#), [http_init\(\)](#), [IMAP](#), [imap_init\(\)](#), [log_check](#), [log_pedantic](#), [MOLTEN](#), [molten_init\(\)](#), [POP](#), [pop_init\(\)](#), [SMTP](#), [smtp_init\(\)](#), [stats_increment_by_name\(\)](#), [SUBMISSION](#), and [submission_init\(\)](#).

Referenced by [protocol_process\(\)](#), and [protocol_secure\(\)](#).

5.129.1.2 bool_t protocol_init (void)

Initialize all protocol modules, and prime their command arrays for binary searching. [protocol.c](#)

Returns:

This function always returns true.

Definition at line 86 of file protocol.c.

References [dmtplib_sort\(\)](#), [imap_sort\(\)](#), [molten_sort\(\)](#), [pop_sort\(\)](#), [portal_endpoint_sort\(\)](#), and [smtp_sort\(\)](#).

Referenced by [process_start\(\)](#).

5.129.1.3 void protocol_process (server_t * server, int sockd)

Create a connection object for an accepted connection, and enqueue it to be handled.

See also:

[protocol_secure\(\)](#), [protocol_enqueue\(\)](#)

Note:

Depending on whether the server specifies a secure transport layer, [protocol_secure\(\)](#) or [protocol_enqueue\(\)](#) will be dispatched.

Parameters:

server a pointer to the server object of the server handling the connection.

sockd the socket descriptor of the newly accepted connection.

Definition at line 201 of file protocol.c.

References [con_init\(\)](#), [connection_t](#), [server_t::context](#), [enqueue\(\)](#), [log_pedantic](#), [net_set_timeout\(\)](#), [server_t::network](#), [protocol_enqueue\(\)](#), [protocol_secure\(\)](#), [server_t::timeout](#), [server_t::tls](#), [TLS_PORT](#), and [server_t::type](#).

Referenced by [net_accept\(\)](#).

5.129.1.4 void protocol_secure (connection_t * con)

Establish a secure channel for an inbound TLS connection before passing it off to the general server request handler.

See also:

[protocol_enqueue\(\)](#)

Note:

This function destroys the client connection completely and returns silently upon any TLS-related failure.

Parameters:

con the The connection object associated with the inbound TLS connection.

Returns:

This function returns no value.

Definition at line 165 of file protocol.c.

References [con_addr_presentation\(\)](#), [log_check](#), [log_pedantic](#), [M_SSL_BIO_NOCLOSE](#), [MANAGEDBUF](#), [mm_free\(\)](#), [mutex_destroy\(\)](#), [protocol_enqueue\(\)](#), [protocol_type\(\)](#), [st_char_get\(\)](#), [st_free\(\)](#), [st_length_int\(\)](#), [status](#), [tls_free\(\)](#), and [tls_server_alloc\(\)](#).

Referenced by [protocol_process\(\)](#).

5.129.1.5 stringer_t* protocol_type (connection_t * con)

Definition at line 11 of file protocol.c.

References [CONSTANT](#), [DMTP](#), [HTTP](#), [IMAP](#), [log_check](#), [MOLTEN](#), [POP](#), [SMTP](#), [SUBMISSION](#), and [TLS_PORT](#).

```
#include "magma.h"
```

Data Structures

- struct [queue_t](#)

Functions

- void [requeue](#) (void *function, void *requeue, void *data)
Push a function on the job queue to be executed asynchronously.
- void [enqueue](#) (void *function, void *data)
Push a function on the job queue to be executed asynchronously.
- void [dequeue](#) (void)
Wait for work to appear on the queue and then perform the work; if the job is to be requeue'd then requeue it.
- void [queue_signal](#) (void)
Signal all worker threads with SIGALRM to force their return.
- [bool_t queue_init](#) (void)
Create a queue of worker threads and set them into motion.
- void [queue_shutdown](#) (void)
Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.

Variables

- struct {
 sem_t [sema](#)
 pthread_t * [workers](#)
 pthread_mutex_t [lock](#)
 [queue_t](#) * [items](#)
} [queue](#)

5.130.1 Function Documentation

5.130.1.1 void dequeue (void)

Wait for work to appear on the queue and then perform the work; if the job is to be requeue'd then requeue it. [queue.c](#)

Note:

This is the thread pool entry point called from [queue_init\(\)](#).

Returns:

This function returns no value.

Definition at line 79 of file queue.c.

References queue_t::data, queue_t::function, log_error, mm_free(), mutex_lock(), mutex_unlock(), queue_t::next, queue, queue_t::requeue(), stats_decrement_by_name(), stats_increment_by_name(), status, thread_start(), and thread_stop().

Referenced by queue_init().

5.130.1.2 void enqueue (void * *function*, void * *data*)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new [queue_t](#) object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

data a pointer to an arbitrary block of data to be passed to the specified function on execution.

Returns:

This function returns no value.

Definition at line 69 of file queue.c.

References requeue().

Referenced by con_reverse_enqueue(), dmtip_process(), dmtip_requeue(), http_process(), http_requeue(), imap_process(), imap_requeue(), molten_init(), molten_invalid(), molten_parse(), molten_stats(), pop_process(), pop_requeue(), protocol_enqueue(), protocol_process(), smtp_process(), and smtp_requeue().

5.130.1.3 bool_t queue_init (void)

Create a queue of worker threads and set them into motion.

Note:

Up to magma.system.worker_threads number of threads will be created.

Returns:

false on failure or true on success.

Definition at line 154 of file queue.c.

References dequeue(), log_error, magma, mm_alloc(), mutex_init(), queue, queue_shutdown(), stats_increment_by_name(), magma_t::system, thread_launch(), and magma_t::worker_threads.

Referenced by process_start().

5.130.1.4 void queue_shutdown (void)

Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.

Returns:

This function returns no value.

Definition at line 188 of file queue.c.

References magma, mm_cleanup, mutex_destroy(), queue, stats_decrement_by_name(), magma_t::system, thread_join(), and magma_t::worker_threads.

Referenced by process_stop(), and queue_init().

5.130.1.5 void queue_signal (void)

Signal all worker threads with SIGALRM to force their return.

Returns:

This function returns no value.

Definition at line 133 of file queue.c.

References log_info, magma, queue, status, magma_t::system, thread_signal(), and magma_t::worker_threads.

Referenced by net_trigger(), and signal_shutdown().

5.130.1.6 void requeue (void *function, void *requeue, void *data)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new [queue_t](#) object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

requeue an optional pointer to a requeue function to be called after function is executed.

data a pointer to an arbitrary block of data to be passed to function and/or requeue upon execution.

Returns:

This function returns no value.

Definition at line 33 of file queue.c.

References queue_t::data, queue_t::function, log_critical, mm_alloc(), mutex_lock(), mutex_unlock(), queue_t::next, queue, and queue_t::requeue().

Referenced by dmtip_process(), enqueue(), http_process(), http_requeue(), imap_process(), pop_process(), sess_release(), smtp_data(), and smtp_process().

Functions

- void [log_disable](#) (void)
Disable logging.
- void [log_enable](#) (void)
Enable logging.
- [int_t log_backtrace](#) (FILE *output)
Log the current stack to stdout.
- void [log_internal](#) (const char *file, const char *function, const int line, [M_LOG_OPTIONS](#) options, const char *format,...)
Logs the message described by format, and provided as a variadic argument list.
- void [log_rotate](#) (void)
- [bool_t log_start](#) (void)

Variables

- [uint64_t log_date](#)
- [bool_t log_enabled](#) = true
- FILE * [log_descriptor](#) = NULL
- [pthread_mutex_t log_mutex](#) = PTHREAD_MUTEX_INITIALIZER

5.132.1 Function Documentation

5.132.1.1 [int_t log_backtrace](#) (FILE * *output*)

Log the current stack to stdout.

Note:

This function was created because `backtrace_symbols()` can fail if there is heap corruption.

Returns:

-1 if the backtrace failed, or 0 on success.

Definition at line 42 of file `log.c`.

Referenced by `log_internal()`.

5.132.1.2 [void log_disable](#) (void)

Disable logging.

Returns:

This function returns no value.

Definition at line 19 of file `log.c`.

References `log_enabled`, `log_mutex`, `mutex_lock()`, and `mutex_unlock()`.

5.132.1.3 void log_enable (void)

Enable logging.

Returns:

This function returns no value.

Definition at line 30 of file log.c.

References log_enabled, log_mutex, mutex_lock(), and mutex_unlock().

5.132.1.4 void log_internal (const char **file*, const char **function*, const int *line*, M_LOG_OPTIONS *options*, const char **format*, ...)

Logs the message described by format, and provided as a variadic argument list.

Parameters:

file The log macros set this to the caller's filename.

function The log macros set this to the caller's function.

line The log macros set this to the line number where the log function was called.

options Global configuration options can be overridden on a per call basis using the options variable.

format The printf style format for the log message.

va_list A variadic list of data items to be used by the format string.

Returns:

This function returns no value.

Definition at line 112 of file log.c.

References magma_t::file, magma_t::function, magma_t::line, magma_t::log, log_backtrace(), log_descriptor, log_enabled, log_mutex, M_LOG_CONSOLE, M_LOG_FILE, M_LOG_FILE_DISABLE, M_LOG_FUNCTION, M_LOG_FUNCTION_DISABLE, M_LOG_LINE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME, M_LOG_TIME_DISABLE, magma, mutex_lock(), mutex_unlock(), magma_t::output, magma_t::stack, and magma_t::time.

```
#include "magma.h"
```

Functions

- `const char * build_version (void)`
Get the magma version string.
- `const char * build_commit (void)`
Get the magma commit identity.
- `const char * build_stamp (void)`
Get the magma build stamp.
- `uint64_t build_version_major (void)`
Get the magma major version number.
- `uint64_t build_version_minor (void)`
Get the magma minor version number.
- `uint64_t build_version_patch (void)`
Get the magma patch level.

5.134.1 Function Documentation

5.134.1.1 `const char* build_commit (void)`

Get the magma commit identity. [build.c](#)

Returns:

a pointer to a null-terminated string containing the last eight characters of current commit identity.

Definition at line 34 of file `build.c`.

Referenced by `args_parse()`, and `lib_load()`.

5.134.1.2 `const char* build_stamp (void)`

Get the magma build stamp.

Returns:

a pointer to a null-terminated string containing the magma build information string.

Definition at line 42 of file `build.c`.

Referenced by `args_parse()`, `http_response_options()`, `imap_id()`, and `lib_load()`.

5.134.1.3 `const char* build_version (void)`

Get the magma version string.

Returns:

a pointer to a null-terminated string containing the magma version string.

Definition at line 26 of file build.c.

Referenced by `args_parse()`, `http_response_options()`, `imap_id()`, `imap_init()`, `lib_load()`, and `pop_capa()`.

5.134.1.4 `uint64_t build_version_major (void)`

Get the magma major version number.

Returns:

an unsigned integer with the major version number.

Definition at line 50 of file build.c.

References `ns_length_get()`, `pl_null()`, `PLACER`, `placer_t`, `tok_get_st()`, and `uint64_conv_pl()`.

5.134.1.5 `uint64_t build_version_minor (void)`

Get the magma minor version number.

Returns:

an unsigned integer with the minor version number.

Definition at line 66 of file build.c.

References `ns_length_get()`, `pl_null()`, `PLACER`, `placer_t`, `tok_get_st()`, and `uint64_conv_pl()`.

5.134.1.6 `uint64_t build_version_patch (void)`

Get the magma patch level.

Returns:

an unsigned integer with the patch level.

Definition at line 82 of file build.c.

References `ns_length_get()`, `pl_null()`, `PLACER`, `placer_t`, `tok_get_st()`, and `uint64_conv_pl()`.

5.135 src/engine/status/performance.c File Reference

```
#include "magma.h"
```

Functions

- `uint64_t perf_rdtsc` (void)
performance.c

5.135.1 Function Documentation

5.135.1.1 `uint64_t perf_rdtsc` (void)

[performance.c](#) Returns the CPU cycle counter. By calculating variations in the time stamp, we can discover the exact number of elapsed CPU ticks, making it possible to precisely time code execution. Note that in a multithreaded environment its possible that not all of the elapsed ticks were consumed by the code being timed.

Returns:

The number of CPU cycles that have elapsed since boot.

Definition at line 180 of file `performance.c`.

5.136 src/engine/status/statistics.c File Reference

```
#include "magma.h"
```

Functions

- `uint64_t stats_sum_errors` (void)
Get the total sum of all error statistics maintained by magma (traditional and derived stats).
- `uint64_t stats_derived_count` (void)
Get the number of derived statistics that are tracked.
- `char * stats_derived_name` (uint64_t position)
Get the name of a derived statistic by index.
- `uint64_t stats_derived_value` (uint64_t position)
Get the value of a derived statistic by index.
- `uint64_t stats_get_name_pos` (char *name)
Get the index of a statistic by name.
- `char * stats_get_name` (uint64_t position)
Get the name of a statistic by its index.
- `void stats_set_by_name` (char *name, uint64_t value)
Provided a statistic by name, set its value.
- `void stats_set_by_num` (uint64_t position, uint64_t value)
Provided a statistic by index, set its value.
- `uint64_t stats_get_value_by_name` (char *name)
Provided a statistic by name, get its value.
- `uint64_t stats_get_value_by_num` (uint64_t position)
Provided a statistic by index, get its value.
- `void stats_adjust_by_name` (char *name, int32_t value)
Provided a statistic by name, increment its value by a specified amount.
- `void stats_adjust_by_num` (uint64_t position, int32_t value)
Provided a statistic by index, increment its value by a specified amount.
- `void stats_increment_by_name` (char *name)
Provided a statistic by name, increment its value by 1.
- `void stats_increment_by_num` (uint64_t position)
Provided a statistic by index, increment its value by 1.
- `void stats_decrement_by_name` (char *name)
Provided a statistic by name, decrement its value by 1.
- `void stats_decrement_by_num` (uint64_t position)

Provided a statistic by index, decrement its value by 1.

- `uint64_t stats_get_count (void)`
Get the number of statistics being tracked.
- `bool_t stats_init (void)`
Initialize and reset all statistics counters.
- `void stats_shutdown (void)`
Destroy all statistics locks.

Variables

- struct {
 size_t `count`
 pthread_mutex_t `locks` [128][2]
 uint64_t `values` [128]
 char * `names` [128]
} `stats`
- char * `derived` []

5.136.1 Function Documentation

5.136.1.1 void stats_adjust_by_name (char * *name*, int32_t *value*)

Provided a statistic by name, increment its value by a specified amount. statistics.c

Parameters:

- name*** a null-terminated string containing the name of the statistic to be set.
value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 360 of file statistics.c.

References `mutex_lock()`, `mutex_unlock()`, `stats`, and `stats_get_name_pos()`.

Referenced by `dkim_signature_create()`, `dkim_signature_verify()`, `obj_cache_prune()`, `pattern_check()`, and `spf_check()`.

5.136.1.2 void stats_adjust_by_num (uint64_t *position*, int32_t *value*)

Provided a statistic by index, increment its value by a specified amount.

Parameters:

- position*** the zero-based index of the statistic to be set.
value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 381 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.136.1.3 void stats_decrement_by_name (char * *name*)

Provided a statistic by name, decrement its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 429 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by con_destroy(), dequeue(), and queue_shutdown().

5.136.1.4 void stats_decrement_by_num (uint64_t *position*)

Provided a statistic by index, decrement its value by 1.

Parameters:

position the zero-based index of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 449 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.136.1.5 uint64_t stats_derived_count (void)

Get the number of derived statistics that are tracked.

Returns:

the number of derived statistics being maintained by magma.

Definition at line 183 of file statistics.c.

References derived.

Referenced by molten_stats(), stats_derived_name(), and stats_sum_errors().

5.136.1.6 char* stats_derived_name (uint64_t *position*)

Get the name of a derived statistic by index.

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string containing the name of the derived statistic on success.

Definition at line 193 of file statistics.c.

References `derived`, and `stats_derived_count()`.

Referenced by `molten_stats()`, and `stats_sum_errors()`.

5.136.1.7 uint64_t stats_derived_value (uint64_t position)

Get the value of a derived statistic by index.

See also:

[mm_sec_stats\(\)](#)

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

0 on failure, or the value of the specified derived statistic on success.

Definition at line 208 of file statistics.c.

References `bytes`, `items`, `log_pedantic`, `mm_sec_stats()`, `spool_error_stats()`, and `stats_sum_errors()`.

Referenced by `molten_stats()`, and `stats_sum_errors()`.

5.136.1.8 uint64_t stats_get_count (void)

Get the number of statistics being tracked.

Returns:

the total number of statistics counters maintained by magma.

Definition at line 462 of file statistics.c.

References `stats`.

Referenced by `molten_stats()`, and `stats_sum_errors()`.

5.136.1.9 char* stats_get_name (uint64_t position)

Get the name of a statistic by its index.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

0 on failure, or the name of the requested statistic on success.

Definition at line 272 of file statistics.c.

References `mutex_lock()`, `mutex_unlock()`, and `stats`.

Referenced by `molten_stats()`, and `stats_sum_errors()`.

5.136.1.10 `uint64_t stats_get_name_pos (char * name)`

Get the index of a statistic by name.

Parameters:

name the name of the statistic to be queried.

Returns:

0 on failure, or the zero-based index of the requested statistic on success.

Definition at line 251 of file statistics.c.

References `log_info`, `mutex_lock()`, `mutex_unlock()`, `NULLER`, `st_cmp_cs_eq()`, and `stats`.

Referenced by `stats_adjust_by_name()`, `stats_decrement_by_name()`, `stats_get_value_by_name()`, `stats_increment_by_name()`, and `stats_set_by_name()`.

5.136.1.11 `uint64_t stats_get_value_by_name (char * name)`

Provided a statistic by name, get its value.

Parameters:

name a null-terminated string containing the name of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 323 of file statistics.c.

References `mutex_lock()`, `mutex_unlock()`, `stats`, and `stats_get_name_pos()`.

5.136.1.12 `uint64_t stats_get_value_by_num (uint64_t position)`

Provided a statistic by index, get its value.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 343 of file statistics.c.

References `mutex_lock()`, `mutex_unlock()`, and `stats`.

Referenced by `molten_stats()`, and `stats_sum_errors()`.

5.136.1.13 `void stats_increment_by_name (char * name)`

Provided a statistic by name, increment its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 395 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dequeue(), imap_starttls(), pop_starttls(), protocol_enqueue(), queue_init(), register_abuse_check_blocklist(), smtp_starttls(), virus_check(), virus_engine_refresh(), and virus_start().

5.136.1.14 void stats_increment_by_num (uint64_t *position*)

Provided a statistic by index, increment its value by 1.

Parameters:

position the zero-based index of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 415 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.136.1.15 bool_t stats_init (void)

Initialize and reset all statistics counters.

Returns:

false on failure or true on success.

Definition at line 471 of file statistics.c.

References log_critical, mm_wipe(), mutex_init(), and stats.

Referenced by process_start().

5.136.1.16 void stats_set_by_name (char * *name*, uint64_t *value*)

Provided a statistic by name, set its value.

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 289 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by obj_cache_prune(), virus_engine_refresh(), virus_start(), and virus_stop().

5.136.1.17 void stats_set_by_num (uint64_t position, uint64_t value)

Provided a statistic by index, set its value.

Parameters:

position the zero-based index of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 309 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.136.1.18 void stats_shutdown (void)

Destroy all statistics locks.

Returns:

This function returns no value.

Definition at line 494 of file statistics.c.

References mutex_destroy(), and stats.

Referenced by process_stop().

5.136.1.19 uint64_t stats_sum_errors (void)

Get the total sum of all error statistics maintained by magma (traditional and derived stats).

Note:

Error statistics are all statistics that have a name that begins with "errors." or ends with ".errors".

Returns:

The total sum of all error statistics counters accumulated by magma.

Definition at line 137 of file statistics.c.

References CONSTANT, NULLER, st_cmp_cs_ends(), st_cmp_cs_eq(), st_cmp_cs_starts(), stats_derived_count(), stats_derived_name(), stats_derived_value(), stats_get_count(), stats_get_name(), and stats_get_value_by_num().

Referenced by stats_derived_value().

Functions

- void [statistics_process](#) ([connection_t](#) *con)

Display the statistics page to the requesting connection.

Variables

- [statistics_vp_t portal_stats](#) [12]

5.137.1 Function Documentation

5.137.1.1 void [statistics_process](#) ([connection_t](#) * con)

Display the statistics page to the requesting connection. [statistics.c](#)

Parameters:

con a pointer to the connection object across which the server statistics will be transmitted.

Returns:

This function returns no value.

Definition at line 17 of file [statistics.c](#).

References [con_write_st\(\)](#), [http_page_free\(\)](#), [http_page_get\(\)](#), [http_print_500\(\)](#), [http_response_header\(\)](#), [log_pedantic](#), [portal_stat_emails_received_today](#), [portal_stat_emails_received_week](#), [portal_stat_emails_sent_today](#), [portal_stat_emails_sent_week](#), [portal_stat_total_users](#), [portal_stat_users_checked_email_today](#), [portal_stat_users_checked_email_week](#), [portal_stat_users_registered_today](#), [portal_stat_users_registered_week](#), [portal_stat_users_sent_email_today](#), [portal_stat_users_sent_email_week](#), [st_free\(\)](#), [st_length_get\(\)](#), [statistics_refresh\(\)](#), [statistics_vp_t::val](#), [xml_dump_doc\(\)](#), [xml_set_xpath_ns\(\)](#), and [xml_set_xpath_uint64\(\)](#).

#include "magma.h"
```

Functions

- `bool_t status` (void)
Check to see if a worker thread should continue processing.
- void `status_set` (int value)
Set the status level to provided value.
- void `status_signal` (void)
Enqueued by the signal handler so the status can be updated asynchronously.
- int `status_get` (void)
Get the current status level.
- void `status_process` (void)
Update magma's basic process information (pid and start time).
- uint64_t `status_pid` (void)
Get the magma instance's pid.
- uint64_t `status_startup` (void)
Get the timestamp corresponding to when magma was started.

Variables

- struct {
 pid_t `pid`
 uint64_t `startup`
} `process`
- int `status_level` = 0
- pthread_rwlock_t `status_lock` = PTHREAD_RWLOCK_INITIALIZER

5.138.1 Function Documentation

5.138.1.1 `bool_t status` (void)

Check to see if a worker thread should continue processing. [status.c](#)

Note:

This function should be called periodically by worker threads.

Returns:

true if the caller should continue processing (status level is positive) or false otherwise.

Definition at line 26 of file `status.c`.

References `rwlock_lock_read()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

5.138.1.2 `int status_get (void)`

Get the current status level.

See also:

[status\(\)](#)

Returns:

the current value of the status level.

Definition at line 66 of file status.c.

References `rwlock_lock_read()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

5.138.1.3 `uint64_t status_pid (void)`

Get the magma instance's pid.

Returns:

the value of magma's pid.

Definition at line 88 of file status.c.

References `process`.

5.138.1.4 `void status_process (void)`

Update magma's basic process information (pid and start time).

Returns:

This function returns no value.

Definition at line 78 of file status.c.

References `process`, and `process_my_pid()`.

Referenced by `process_start()`, `system_fork_daemon()`, and `system_init_impersonation()`.

5.138.1.5 `void status_set (int value)`

Set the status level to provided value.

See also:

[status\(\)](#)

Parameters:

value the integer value of the new status level.

Returns:

This function returns no value.

Definition at line 43 of file status.c.

References `rwlock_lock_write()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

Referenced by `main()`.

5.138.1.6 void status_signal (void)

Enqueued by the signal handler so the status can be updated asynchronously.

Definition at line 53 of file status.c.

References log_pedantic, rwlock_lock_write(), rwlock_unlock(), status_level, and status_lock.

Referenced by signal_shutdown().

5.138.1.7 uint64_t status_startup (void)

Get the timestamp corresponding to when magma was started.

Returns:

the UNIX-style date-time value when magma was started.

Definition at line 96 of file status.c.

References process.

5.138.2 Variable Documentation

5.138.2.1 pid_t pid

Definition at line 11 of file status.c.

Referenced by main(), process_find_pid(), process_kill(), and system_fork_daemon().

5.138.2.2 struct { ... } process

Referenced by status_pid(), status_process(), and status_startup().

Functions

- void [stats_adjust_by_name](#) (char *name, int32_t value)
statistics.c
- void [stats_adjust_by_num](#) (uint64_t position, int32_t value)
Provided a statistic by index, increment its value by a specified amount.
- void [stats_decrement_by_name](#) (char *name)
Provided a statistic by name, decrement its value by 1.
- void [stats_decrement_by_num](#) (uint64_t position)
Provided a statistic by index, decrement its value by 1.
- uint64_t [stats_derived_count](#) (void)
Get the number of derived statistics that are tracked.
- char * [stats_derived_name](#) (uint64_t position)
Get the name of a derived statistic by index.
- uint64_t [stats_derived_value](#) (uint64_t position)
Get the value of a derived statistic by index.
- uint64_t [stats_get_count](#) (void)
Get the number of statistics being tracked.
- char * [stats_get_name](#) (uint64_t position)
Get the name of a statistic by its index.
- uint64_t [stats_get_name_pos](#) (char *name)
Get the index of a statistic by name.
- uint64_t [stats_get_value_by_name](#) (char *name)
Provided a statistic by name, get its value.
- uint64_t [stats_get_value_by_num](#) (uint64_t position)
Provided a statistic by index, get its value.
- void [stats_increment_by_name](#) (char *name)
Provided a statistic by name, increment its value by 1.
- void [stats_increment_by_num](#) (uint64_t position)
Provided a statistic by index, increment its value by 1.
- bool_t [stats_init](#) (void)
Initialize and reset all statistics counters.
- void [stats_set_by_name](#) (char *name, uint64_t value)
Provided a statistic by name, set its value.
- void [stats_set_by_num](#) (uint64_t position, uint64_t value)

Provided a statistic by index, set its value.

- void [stats_shutdown](#) (void)
Destroy all statistics locks.
- uint64_t [stats_sum_errors](#) (void)
Get the total sum of all error statistics maintained by magma (traditional and derived stats).
- uint64_t [perf_rdtsc](#) (void)
performance.c
- const char * [build_commit](#) (void)
build.c
- const char * [build_stamp](#) (void)
Get the magma build stamp.
- const char * [build_version](#) (void)
Get the magma version string.
- uint64_t [build_version_major](#) (void)
Get the magma major version number.
- uint64_t [build_version_minor](#) (void)
Get the magma minor version number.
- uint64_t [build_version_patch](#) (void)
Get the magma patch level.
- [bool_t status](#) (void)
status.c
- int [status_get](#) (void)
Get the current status level.
- uint64_t [status_pid](#) (void)
Get the magma instance's pid.
- void [status_process](#) (void)
Update magma's basic process information (pid and start time).
- void [status_set](#) (int value)
Set the status level to provided value.
- void [status_signal](#) (void)
Enqueued by the signal handler so the status can be updated asynchronously.
- uint64_t [status_startup](#) (void)
Get the timestamp corresponding to when magma was started.

5.139.1 Function Documentation

5.139.1.1 `const char* build_commit (void)`

[build.c](#) [build.c](#)

Returns:

a pointer to a null-terminated string containing the last eight characters of current commit identity.

Definition at line 34 of file `build.c`.

Referenced by `args_parse()`, and `lib_load()`.

5.139.1.2 `const char* build_stamp (void)`

Get the magma build stamp.

Returns:

a pointer to a null-terminated string containing the magma build information string.

Definition at line 42 of file `build.c`.

Referenced by `args_parse()`, `http_response_options()`, `imap_id()`, and `lib_load()`.

5.139.1.3 `const char* build_version (void)`

Get the magma version string.

Returns:

a pointer to a null-terminated string containing the magma version string.

Definition at line 26 of file `build.c`.

Referenced by `args_parse()`, `http_response_options()`, `imap_id()`, `imap_init()`, `lib_load()`, and `pop_capa()`.

5.139.1.4 `uint64_t build_version_major (void)`

Get the magma major version number.

Returns:

an unsigned integer with the major version number.

Definition at line 50 of file `build.c`.

References `ns_length_get()`, `pl_null()`, `PLACER`, `placer_t`, `tok_get_st()`, and `uint64_conv_pl()`.

5.139.1.5 `uint64_t build_version_minor (void)`

Get the magma minor version number.

Returns:

an unsigned integer with the minor version number.

Definition at line 66 of file `build.c`.

References `ns_length_get()`, `pl_null()`, `PLACER`, `placer_t`, `tok_get_st()`, and `uint64_conv_pl()`.

5.139.1.6 uint64_t build_version_patch (void)

Get the magma patch level.

Returns:

an unsigned integer with the patch level.

Definition at line 82 of file build.c.

References ns_length_get(), pl_null(), PLACER, placer_t, tok_get_st(), and uint64_conv_pl().

5.139.1.7 uint64_t perf_rdtsc (void)

[performance.c](#) Returns the CPU cycle counter. By calculating variations in the time stamp, we can discover the exact number of elapsed CPU ticks, making it possible to precisely time code execution. Note that in a multithreaded environment its possible that not all of the elapsed ticks were consumed by the code being timed.

Returns:

The number of CPU cycles that have elapsed since boot.

Definition at line 180 of file performance.c.

5.139.1.8 void stats_adjust_by_name (char * name, int32_t value)

statistics.c statistics.c

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 360 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dkim_signature_create(), dkim_signature_verify(), obj_cache_prune(), pattern_check(), and spf_check().

5.139.1.9 void stats_adjust_by_num (uint64_t position, int32_t value)

Provided a statistic by index, increment its value by a specified amount.

Parameters:

position the zero-based index of the statistic to be set.

value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 381 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.139.1.10 void stats_decrement_by_name (char * *name*)

Provided a statistic by name, decrement its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 429 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by con_destroy(), dequeue(), and queue_shutdown().

5.139.1.11 void stats_decrement_by_num (uint64_t *position*)

Provided a statistic by index, decrement its value by 1.

Parameters:

position the zero-based index of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 449 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.139.1.12 uint64_t stats_derived_count (void)

Get the number of derived statistics that are tracked.

Returns:

the number of derived statistics being maintained by magma.

Definition at line 183 of file statistics.c.

References derived.

Referenced by molten_stats(), stats_derived_name(), and stats_sum_errors().

5.139.1.13 char* stats_derived_name (uint64_t *position*)

Get the name of a derived statistic by index.

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string containing the name of the derived statistic on success.

Definition at line 193 of file statistics.c.

References derived, and stats_derived_count().

Referenced by molten_stats(), and stats_sum_errors().

5.139.1.14 uint64_t stats_derived_value (uint64_t *position*)

Get the value of a derived statistic by index.

See also:

[mm_sec_stats\(\)](#)

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

0 on failure, or the value of the specified derived statistic on success.

Definition at line 208 of file statistics.c.

References bytes, items, log_pedantic, mm_sec_stats(), spool_error_stats(), and stats_sum_errors().

Referenced by molten_stats(), and stats_sum_errors().

5.139.1.15 uint64_t stats_get_count (void)

Get the number of statistics being tracked.

Returns:

the total number of statistics counters maintained by magma.

Definition at line 462 of file statistics.c.

References stats.

Referenced by molten_stats(), and stats_sum_errors().

5.139.1.16 char* stats_get_name (uint64_t *position*)

Get the name of a statistic by its index.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

0 on failure, or the name of the requested statistic on success.

Definition at line 272 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

Referenced by molten_stats(), and stats_sum_errors().

5.139.1.17 uint64_t stats_get_name_pos (char * *name*)

Get the index of a statistic by name.

Parameters:

name the name of the statistic to be queried.

Returns:

0 on failure, or the zero-based index of the requested statistic on success.

Definition at line 251 of file statistics.c.

References log_info, mutex_lock(), mutex_unlock(), NULLER, st_cmp_cs_eq(), and stats.

Referenced by stats_adjust_by_name(), stats_decrement_by_name(), stats_get_value_by_name(), stats_increment_by_name(), and stats_set_by_name().

5.139.1.18 uint64_t stats_get_value_by_name (char * name)

Provided a statistic by name, get its value.

Parameters:

name a null-terminated string containing the name of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 323 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

5.139.1.19 uint64_t stats_get_value_by_num (uint64_t position)

Provided a statistic by index, get its value.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 343 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

Referenced by molten_stats(), and stats_sum_errors().

5.139.1.20 void stats_increment_by_name (char * name)

Provided a statistic by name, increment its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 395 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dequeue(), imap_starttls(), pop_starttls(), protocol_enqueue(), queue_init(), register_abuse_check_blocklist(), smtp_starttls(), virus_check(), virus_engine_refresh(), and virus_start().

5.139.1.21 void stats_increment_by_num (uint64_t *position*)

Provided a statistic by index, increment its value by 1.

Parameters:

position the zero-based index of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 415 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.139.1.22 bool_t stats_init (void)

Initialize and reset all statistics counters.

Returns:

false on failure or true on success.

Definition at line 471 of file statistics.c.

References log_critical, mm_wipe(), mutex_init(), and stats.

Referenced by process_start().

5.139.1.23 void stats_set_by_name (char * *name*, uint64_t *value*)

Provided a statistic by name, set its value.

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 289 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by obj_cache_prune(), virus_engine_refresh(), virus_start(), and virus_stop().

5.139.1.24 void stats_set_by_num (uint64_t *position*, uint64_t *value*)

Provided a statistic by index, set its value.

Parameters:

position the zero-based index of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 309 of file statistics.c.

References `mutex_lock()`, `mutex_unlock()`, and `stats`.

5.139.1.25 `void stats_shutdown (void)`

Destroy all statistics locks.

Returns:

This function returns no value.

Definition at line 494 of file statistics.c.

References `mutex_destroy()`, and `stats`.

Referenced by `process_stop()`.

5.139.1.26 `uint64_t stats_sum_errors (void)`

Get the total sum of all error statistics maintained by magma (traditional and derived stats).

Note:

Error statistics are all statistics that have a name that begins with "errors." or ends with ".errors".

Returns:

The total sum of all error statistics counters accumulated by magma.

Definition at line 137 of file statistics.c.

References `CONSTANT`, `NULLER`, `st_cmp_cs_ends()`, `st_cmp_cs_eq()`, `st_cmp_cs_starts()`, `stats_derived_count()`, `stats_derived_name()`, `stats_derived_value()`, `stats_get_count()`, `stats_get_name()`, and `stats_get_value_by_num()`.

Referenced by `stats_derived_value()`.

5.139.1.27 `bool_t status (void)`

[status.c](#) [status.c](#)

Note:

This function should be called periodically by worker threads.

Returns:

true if the caller should continue processing (status level is positive) or false otherwise.

Definition at line 26 of file status.c.

References `rwlock_lock_read()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

5.139.1.28 `int status_get (void)`

Get the current status level.

See also:

[status\(\)](#)

Returns:

the current value of the status level.

Definition at line 66 of file status.c.

References `rwlock_lock_read()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

5.139.1.29 uint64_t status_pid (void)

Get the magma instance's pid.

Returns:

the value of magma's pid.

Definition at line 88 of file status.c.

References `process`.

5.139.1.30 void status_process (void)

Update magma's basic process information (pid and start time).

Returns:

This function returns no value.

Definition at line 78 of file status.c.

References `process`, and `process_my_pid()`.

Referenced by `process_start()`, `system_fork_daemon()`, and `system_init_impersonation()`.

5.139.1.31 void status_set (int value)

Set the status level to provided value.

See also:

[status\(\)](#)

Parameters:

value the integer value of the new status level.

Returns:

This function returns no value.

Definition at line 43 of file status.c.

References `rwlock_lock_write()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

Referenced by `main()`.

5.139.1.32 void status_signal (void)

Enqueued by the signal handler so the status can be updated asynchronously.

Definition at line 53 of file status.c.

References `log_pedantic`, `rwlock_lock_write()`, `rwlock_unlock()`, `status_level`, and `status_lock`.

Referenced by `signal_shutdown()`.

5.139.1.33 `uint64_t status_startup (void)`

Get the timestamp corresponding to when magma was started.

Returns:

the UNIX-style date-time value when magma was started.

Definition at line 96 of file `status.c`.

References `process`.

Functions

- `ip_t * con_addr (connection_t *con, ip_t *output)`
Return the IP address information of the remote end of a client connection.
- `stringer_t * con_addr_presentation (connection_t *con, stringer_t *output)`
Return a textual representation of the IP address of a specified connection handle.
- `stringer_t * con_addr_standard (connection_t *con, stringer_t *output)`
Get the IP address string for the client connection.
- `stringer_t * con_addr_reversed (connection_t *con, stringer_t *output)`
Get the reversed-IP address string for a client connection.
- `stringer_t * con_addr_subnet (connection_t *con, stringer_t *output)`
Get the subnet string for a specified connection.
- `uint32_t con_addr_word (connection_t *con, int_t position)`
Get a specified 32-bit segment of a connection's peer IP address.
- `octet_t con_addr_octet (connection_t *con, int_t position)`
Get a specified 8-bit octet of a connection's peer IP address.
- `segment_t con_addr_segment (connection_t *con, int_t position)`
Extract a specified 16 bit segment from a connection's peer IP address.

5.142.1 Function Documentation

5.142.1.1 ip_t* con_addr (connection_t * con, ip_t * output)

Return the IP address information of the remote end of a client connection. [addresses.c](#)

Parameters:

con the input client connection.

output a pointer to an `ip_t` structure to receive the remote IP address, which is allocated for the caller if output is NULL.

Returns:

NULL on error, or a pointer to the IP address of the remote host.

Definition at line 16 of file `addresses.c`.

References `ip_t::ip`.

Referenced by `con_addr_octet()`, `con_addr_presentation()`, `con_addr_reversed()`, `con_addr_segment()`, `con_addr_standard()`, `con_addr_subnet()`, `con_addr_word()`, `sess_create()`, `sess_get()`, `smtp_bypass_check()`, and `smtp_rcpt_to()`.

5.142.1.2 `octet_t con_addr_octet (connection_t * con, int_t position)`

Get a specified 8-bit octet of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 8-bit octets that comprise the target IP address.

Returns:

-1 on error, or the specified 8-bit octet of the passed address on success.

Definition at line 152 of file addresses.c.

References `con_addr()`, and `ip_octet()`.

5.142.1.3 `stringer_t* con_addr_presentation (connection_t * con, stringer_t * output)`

Return a textual representation of the IP address of a specified connection handle.

Parameters:

con the remote connection to be queried.

output a managed string to store the result, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 62 of file addresses.c.

References `con_addr()`, and `ip_presentation()`.

Referenced by `api_endpoint_auth()`, `contact_abuse_checks()`, `contact_abuse_increment_history()`, `contact_business()`, `imap_id()`, `imap_login()`, `mail_add_inbound_headers()`, `mail_add_outbound_headers()`, `pop_pass()`, `portal_endpoint_auth()`, `portal_meta()`, `protocol_secure()`, `register_abuse_checks()`, `register_data_insert_user()`, `register_session_cache()`, `register_session_get()`, `smtp_auth_login()`, `smtp_auth_plain()`, and `smtp_rcpt_to()`.

5.142.1.4 `stringer_t* con_addr_reversed (connection_t * con, stringer_t * output)`

Get the reversed-IP address string for a client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if passed as NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address on success.

Definition at line 98 of file addresses.c.

References `con_addr()`, and `ip_reversed()`.

Referenced by `smtp_check_greylist()`, and `smtp_check_rbl()`.

5.142.1.5 `segment_t con_addr_segment(connection_t * con, int_t position)`

Extract a specified 16 bit segment from a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position the zero-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 170 of file addresses.c.

References `con_addr()`, and `ip_segment()`.

5.142.1.6 `stringer_t* con_addr_standard(connection_t * con, stringer_t * output)`

Get the IP address string for the client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 80 of file addresses.c.

References `con_addr()`, and `ip_standard()`.

Referenced by `register_abuse_check_blocklist()`, `register_abuse_checks()`, and `register_abuse_increment_history()`.

5.142.1.7 `stringer_t* con_addr_subnet(connection_t * con, stringer_t * output)`

Get the subnet string for a specified connection.

Parameters:

con the client connection to be queried.

output a managed string that will store the output of the subnet string lookup.

Returns:

NULL on failure, or a managed string containing a textual representation of a subnet address on success.

Definition at line 116 of file addresses.c.

References `con_addr()`, and `ip_subnet()`.

Referenced by `api_endpoint_auth()`, `imap_login()`, `pop_pass()`, `portal_endpoint_auth()`, `smtp_auth_login()`, `smtp_auth_plain()`, `smtp_check_receive_quota()`, and `smtp_update_receive_stats()`.

5.142.1.8 uint32_t con_addr_word (connection_t * *con*, int_t *position*)

Get a specified 32-bit segment of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

-1 if the connecting address can't be looked up, 0 on general error, or the specified 32-bit segment of the passed address on success.

Definition at line 134 of file addresses.c.

References `con_addr()`, and `ip_word()`.

5.143 src/network/clients.c File Reference

```
#include "magma.h"
```

Functions

- [int_t client_status](#) ([client_t](#) *client)
Get the status of a network client.
- [int_t client_secure](#) ([client_t](#) *client)
Establish a TLS connection with a network client instance.
- [client_t * client_connect](#) ([chr_t](#) *host, uint32_t port)
Establish a network client connection to a remote host.
- void [client_close](#) ([client_t](#) *client)
Close a network client connection.

5.143.1 Function Documentation

5.143.1.1 void client_close (client_t * client)

Close a network client connection. [clients.c](#)

Note:

If ssl is in use, this will also destroy the overlying ssl session.

Returns:

This function returns no value.

Definition at line 175 of file clients.c.

References [mm_cleanup](#), [mm_free\(\)](#), [st_cleanup](#), and [tls_free\(\)](#).

Referenced by [net_trigger\(\)](#), [smtp_client_close\(\)](#), and [smtp_client_connect\(\)](#).

5.143.1.2 client_t* client_connect (chr_t * host, uint32_t port)

Establish a network client connection to a remote host.

Parameters:

host a pointer to a null-terminated string containing the hostname of the remote server.

port the port number of the server to which the connection will be established.

Returns:

NULL on failure or a pointer to a newly initialized network client object for the connection upon success.

Definition at line 70 of file clients.c.

References [client_t](#), [ip_t::family](#), [FOREIGNDATA](#), [ip_t::ip4](#), [ip_t::ip6](#), [JOINTED](#), [log_pedantic](#), [MEMORYBUF](#), [mm_alloc\(\)](#), [mm_cleanup](#), [mm_copy\(\)](#), [mm_free\(\)](#), [PLACER_T](#), [st_alloc\(\)](#), [STACK](#), and [status](#).

Referenced by [net_trigger\(\)](#), and [smtp_client_connect\(\)](#).

5.143.1.3 `int_t client_secure (client_t * client)`

Establish a TLS connection with a network client instance.

Parameters:

client a pointer to the network client object to have its transport security upgraded.

Returns:

-1 on failure or 0 on success.

Definition at line 45 of file clients.c.

References `tls_client_alloc()`.

Referenced by `smtp_client_connect()`.

5.143.1.4 `int_t client_status (client_t * client)`

Get the status of a network client.

Parameters:

client a pointer to the network client object to be queried.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 15 of file clients.c.

References `tcp_status()`, and `tls_status()`.

Referenced by `client_read()`, and `client_write()`.

5.144 src/network/connections.c File Reference

```
#include "magma.h"
```

Functions

- [int_t con_secure](#) ([connection_t](#) *con)
Return the security level of a specified connection.
- [bool_t con_localhost](#) ([connection_t](#) *con)
Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.
- [bool_t con_private](#) ([connection_t](#) *con)
Determine whether a client connection is with a machine on the same private network.
- [int_t con_status](#) ([connection_t](#) *con)
Return the status of a specified connection.
- void [con_flush](#) ([connection_t](#) *con)
Attempt to flush any buffered data associated with a network connection.
- void [con_destroy](#) ([connection_t](#) *con)
Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.
- [uint64_t con_increment_refs](#) ([connection_t](#) *con)
Increment a connection object's reference counter.
- [uint64_t con_decrement_refs](#) ([connection_t](#) *con)
Decrement a connection object's reference counter.
- [bool_t con_init_network_buffer](#) ([connection_t](#) *con)
Allocate and initialize a new network buffer for a connection, if it is not already associated with one.
- [connection_t](#) * [con_init](#) (int cond, [server_t](#) *server)
Create a new connection object for a client connection.

5.144.1 Function Documentation

5.144.1.1 [uint64_t con_decrement_refs](#) ([connection_t](#) * con)

Decrement a connection object's reference counter. [connections.c](#)

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 210 of file [connections.c](#).

References [mutex_lock\(\)](#), and [mutex_unlock\(\)](#).

Referenced by [con_destroy\(\)](#).

5.144.1.2 void con_destroy (connection_t * con)

Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.

Parameters:

con a pointer to the connection to be destroyed.

Returns:

This function returns no value.

Definition at line 104 of file connections.c.

References con_decrement_refs(), DMTP, dmtplib_session_destroy(), HTTP, http_session_destroy(), IMAP, imap_session_destroy(), mm_cleanup, mm_free(), MOLTEN, molten_session_destroy(), mutex_destroy(), POP, pop_session_destroy(), SMTP, smtp_session_destroy(), st_cleanup, stats_decrement_by_name(), SUBMISSION, and tls_free().

Referenced by con_reverse_lookup(), dmtplib_quit(), http_close(), imap_logout(), molten_quit(), pop_quit(), protocol_enqueue(), and smtp_quit().

5.144.1.3 void con_flush (connection_t * con)

Attempt to flush any buffered data associated with a network connection.

Parameters:

con the input client connection.

Returns:

This function returns no value.

Definition at line 89 of file connections.c.

References net_set_nodelay().

Referenced by smtp_quit().

5.144.1.4 uint64_t con_increment_refs (connection_t * con)

Increment a connection object's reference counter.

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 194 of file connections.c.

References mutex_lock(), and mutex_unlock().

Referenced by con_init().

5.144.1.5 connection_t* con_init (int cond, server_t * server)

Create a new connection object for a client connection.

Parameters:

cond the socket descriptor of the inbound client connection that was just accepted.

server the handle of the server that serviced the inbound request.

Definition at line 250 of file connections.c.

References `con_increment_refs()`, `connection_t`, `mm_alloc()`, `mm_free()`, `mutex_init()`, `server_t::network`, `server_t::sockd`, and `tcp_addr_ip()`.

Referenced by `protocol_process()`.

5.144.1.6 bool_t con_init_network_buffer (connection_t * con)

Allocate and initialize a new network buffer for a connection, if it is not already associated with one.

Note:

A network buffer of size `magma.system.network_buffer` bytes will be allocated for the connection if one does not exist.

Returns:

true if the connection object has been associated with a network buffer or false on failure.

Definition at line 226 of file connections.c.

References `log_info`, `magma`, `magma_t::network_buffer`, `pl_null()`, `st_alloc()`, and `magma_t::system`.

Referenced by `con_read()`, and `con_read_line()`.

5.144.1.7 bool_t con_localhost (connection_t * con)

Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.

See also:

[ip_localhost\(\)](#)

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 32 of file connections.c.

References `ip_localhost()`.

Referenced by `json_api_dispatch()`, `portal_endpoint()`, `portal_endpoint_auth()`, `portal_process()`, and `portal_upload()`.

5.144.1.8 bool_t con_private (connection_t * con)

Determine whether a client connection is with a machine on the same private network.

See also:

[ip_private\(\)](#)

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 48 of file connections.c.

References `ip_localhost()`.

5.144.1.9 `int_t con_secure (connection_t * con)`

Return the security level of a specified connection.

Parameters:

con the input client connection.

Returns:

1 for a secure connection, 0 for insecure, and -1 if the server does not support SSL/TLS.

Definition at line 15 of file connections.c.

Referenced by `contact_process()`, `http_print_301()`, `http_response_cookie()`, `imap_capability()`, `imap_init()`, `imap_login()`, `imap_starttls()`, `json_api_dispatch()`, `pop_capa()`, `pop_pass()`, `pop_starttls()`, `portal_endpoint()`, `portal_endpoint_auth()`, `portal_process()`, `portal_upload()`, `protocol_enqueue()`, `register_process()`, `sess_create()`, `sess_get()`, `smtp_ehlo()`, `smtp_rcpt_to()`, `smtp_starttls()`, and `teacher_process()`.

5.144.1.10 `int_t con_status (connection_t * con)`

Return the status of a specified connection.

Parameters:

con the input client connection.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 64 of file connections.c.

References `tcp_status()`, and `tls_status()`.

Referenced by `con_read()`, `con_read_line()`, `con_write_bl()`, `dmtip_quit()`, `dmtip_requeue()`, `http_requeue()`, `imap_fetch()`, `imap_logout()`, `imap_requeue()`, `pop_quit()`, `pop_requeue()`, `smtp_quit()`, and `smtp_requeue()`.

data_type_8bit

Definition at line 50 of file `dmtp.h`.

5.146.2.2 `enum dmtp_mail_rettype_t`

Enumerator:

return_type_default

return_type_full

return_type_display

return_type_header

Definition at line 43 of file `dmtp.h`.

5.146.2.3 `enum dmtp_mode_t`

Enumerator:

DMTP_MODE_DMTP

DMTP_MODE_SMTP

DMTP_MODE_NONE

dmtp_mode_unknown

dmtp_mode_dual

dmtp_mode_dmtp

dmtp_mode_smtp

dmtp_mode_esmtp

Definition at line 20 of file `dmtp.h`.

5.146.3 Function Documentation

5.146.3.1 `int _sgnt_resolv_dmtp_expect_banner (dmtp_session_t * session)`

Attempt to receive a valid DMTP banner immediately after a connection is established.

Parameters:

session a pointer to the DMTP session to have the server banner read.

Returns:

-1 on failure or 0 if a banner was successfully received advertising DMTPv1 compatibility.

Definition at line 1667 of file dmtp.c.

References `_dbgprint()`, `_sgnt_resolv_read_dmtp_line()`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, and `RET_ERROR_INT`.

Referenced by `_dx_connect_dual()`, and `_dx_connect_standard()`.

5.146.3.2 dmtp_mode_t _sgnt_resolv_dmtp_initiate_starttls (dmtp_session_t * session, const char * dxname)

Initiate a DMTP session over a plain TCP connection with the DMTP STARTTLS command.

Note:

The `dxname` argument will be used as a parameter to the STARTTLS command for requesting a TLS certificate explicitly by hostname.

Parameters:

session a pointer to the DMTP session to have its transport security upgraded with TLS.

dxname the name of the DX server providing the TLS service of this DMTP session.

Returns:

`dmtp_mode_unknown` on failure or the active mode of the DMTP session as reported by the server on success.

Definition at line 1585 of file dmtp.c.

References `dmtp_session_t::fd`, `_sgnt_resolv_dmtp_str_to_mode()`, `_sgnt_resolv_read_dmtp_line()`, `_sgnt_resolv_read_dmtp_multiline()`, `_ssl_starttls()`, `chr_isspace`, `dmtp_session_t::con`, `dmtp_mode_dmtp`, `dmtp_mode_unknown`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `dmtp_session_t::mode`, `PUSH_ERROR_FMT`, and `RET_ERROR_CUST`.

Referenced by `_dx_connect_dual()`.

5.146.3.3 int _sgnt_resolv_dmtp_issue_command (dmtp_session_t * session, const char * cmd)

Issue a command to the remote server in a DMTP session.

Parameters:

session a pointer to the DMTP session across which the command will be issued.

cmd a null-terminated string containing the value of the specified DMTP command.

Returns:

-1 on failure or 0 if the command was successfully sent.

Definition at line 1715 of file dmtp.c.

References `_dbgprint()`, `dmtp_session_t::fd`, `dmtp_session_t::con`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `PUSH_ERROR_OPENSSL`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_INT`, and `SSL_write_d`.

Referenced by `_sgnt_resolv_dmtp_ehlo()`, `_sgnt_resolv_dmtp_help()`, `_sgnt_resolv_dmtp_history()`, `_sgnt_resolv_dmtp_send_and_read()`, and `_sgnt_resolv_dmtp_stats()`.

5.146.3.4 char* _sgnt_resolv_dmtp_send_and_read (dmtp_session_t * session, const char * cmd, unsigned short * rcode)

Issue a command to a DMTP server and get the response.

Parameters:

session a pointer to the DMTP session across which the command will be issued.

cmd a null-terminated string containing the value of the specified DMTP command.

rcode

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server on success.

Definition at line 1756 of file dmtplib.c.

References `_sgnt_resolv_dmtplib_issue_command()`, `_sgnt_resolv_dmtplib_read_dmtplib_line()`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, and `RET_ERROR_PTR`.

Referenced by `_sgnt_resolv_dmtplib_data()`, `_sgnt_resolv_dmtplib_get_mode()`, `_sgnt_resolv_dmtplib_get_signet()`, `_sgnt_resolv_dmtplib_mail_from()`, `_sgnt_resolv_dmtplib_noop()`, `_sgnt_resolv_dmtplib_quit()`, `_sgnt_resolv_dmtplib_rcpt_to()`, `_sgnt_resolv_dmtplib_reset()`, and `_sgnt_resolv_dmtplib_verify_signet()`.

5.146.3.5 dmtplib_mode_t _sgnt_resolv_dmtplib_str_to_mode (const char * modestr)

Return the DMTP mode corresponding to a DMTP mode string.

Parameters:

modestr a null-terminated string containing the human-readable name of the mode.

Returns:

the DMTP mode type corresponding to the supplied mode string, or `dmtplib_mode_unknown` otherwise.

Definition at line 1083 of file dmtplib.c.

References `dmtplib_mode_dmtplib`, `dmtplib_mode_esmtplib`, `dmtplib_mode_smtp`, and `dmtplib_mode_unknown`.

Referenced by `_sgnt_resolv_dmtplib_get_mode()`, and `_sgnt_resolv_dmtplib_initiate_starttls()`.

5.146.3.6 int _sgnt_resolv_dmtplib_write_data (dmtplib_session_t * session, const void * buf, size_t buflen)

Write raw data to the remote end of a DMTP session.

Parameters:

session a pointer to the DMTP session to which the data will be written.

buf a pointer to the buffer containing the raw data to be written.

buflen the size, in bytes, of the data buffer to be written to the DMTP session.

Returns:

0 if all requested bytes were written successfully to the connection, or -1 on failure.

Definition at line 1783 of file dmtplib.c.

References `_dbgprint()`, `dmtplib_session_t::fd`, `dmtplib_session_t::con`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `PUSH_ERROR_OPENSSL`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_INT`, and `SSL_write_d`.

Referenced by `_sgnt_resolv_dmtplib_data()`.

5.146.3.7 `char* _sgnt_resolv_parse_line_code (const char * line, unsigned short * rcode, int * multiline)`

Parse a DMTP line into a numerical code and the trailing text.

Parameters:

line a pointer to a null-terminated string to be parsed as a DMTP response line or lines.

rcode an opointer to a variable that will receive the numeric response code of the DMTP reply.

multiline an optional parameter that if set will permit multiline DMTP responses. If this was the final line of a multiline response, the value will be set to 1 when the function returns, or 0 if there is more content to follow.

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server.

Definition at line 1524 of file dmtp.c.

References `chr_isspace`, `ERR_BAD_PARAM`, `ERR_UNSPEC`, `RET_ERROR_PTR`, and `RET_ERROR_PTR_FMT`.

Referenced by `_sgnt_resolv_read_dmtp_line()`.

5.146.3.8 `char* _sgnt_resolv_read_dmtp_line (dmtp_session_t * session, int * overflow, unsigned short * rcode, int * multiline)`

Read a CR/LF-terminated line of input from an active DMTP session.

Parameters:

session a pointer to the DMTP session from which the response line will be read.

overflow an optional pointer to a variable that will be set if the read operation exceeds the size of the internal line buffer.

rcode an optional pointer to a variable that will receive the numeric response code of the DMTP reply that was just received.

multiline an optional parameter that if set will permit multiline DMTP responses. If this was the final line of a multiline response, the value will be set to 1 when the function returns, or 0 if there is more content to follow.

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server.

Definition at line 1292 of file dmtp.c.

References `_dbgprint()`, `dmtp_session_t::fd`, `dmtp_session_t::inbuf`, `dmtp_session_t::inpos`, `_sgnt_resolv_parse_line_code()`, `_ssl_disconnect()`, `dmtp_session_t::active`, `dmtp_session_t::con`, `dmtp_mode_dmtp`, `ERR_BAD_PARAM`, `ERR_NOMEM`, `ERR_UNSPEC`, `dmtp_session_t::mode`, `PUSH_ERROR_OPENSSL`, `PUSH_ERROR_SYSCALL`, `RET_ERROR_PTR`, and `SSL_read_d`.

Referenced by `_sgnt_resolv_dmtp_data()`, `_sgnt_resolv_dmtp_expect_banner()`, `_sgnt_resolv_dmtp_initiate_starttls()`, `_sgnt_resolv_dmtp_send_and_read()`, and `_sgnt_resolv_read_dmtp_multiline()`.

5.146.3.9 `char* _sgnt_resolv_read_dmtp_multiline (dmtp_session_t * session, int * overflow, unsigned short * rcode)`

Read a multiple-line response from the DMTP server.

Note:

A multiline response is designated by the presence of a hyphen between the response code and the responses text. A regular response, or the final line of a multiline response will instead have a space.

Parameters:

session a pointer to the DMTP session from which the response line(s) will be read.

overflow an optional pointer to a variable that will be set if the read operation exceeds the size of the internal line buffer.

rcode an optional pointer to a variable that will receive the numeric response code of the DMTP reply that was just received.

Returns:

NULL on failure or a pointer to a string containing the next response from the DMTP server on success.

Definition at line 1443 of file dmtplib.c.

Destroy the data associated with an DMTP session.

5.147.1 Function Documentation

5.147.1.1 [int_t dmtp_compare](#) (const void * *compare*, const void * *command*)

Definition at line 11 of file `commands.c`.

References `command_t`, `PLACER`, `st_cmp_ci_eq()`, and `st_cmp_ci_starts()`.

Referenced by `dmtp_process()`, and `dmtp_sort()`.

5.147.1.2 [void dmtp_data](#) ([connection_t](#) * *con*)

Process an DMTP MAIL command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 123 of file `dmtp.c`.

References `con_write_bl()`, and `dmtp_requeue()`.

Referenced by `dmtp_process()`.

5.147.1.3 [void dmtp_ehlo](#) ([connection_t](#) * *con*)

`dmtp.c dmtp.c`

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 15 of file `dmtp.c`.

References `con_print()`, `st_char_get()`, and `st_length_int()`.

5.147.1.4 [void dmtp_helo](#) ([connection_t](#) * *con*)

Process an DMTP HELO command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 28 of file `dmtp.c`.

References `con_print()`, `st_char_get()`, and `st_length_int()`.

5.147.1.5 void dmtp_help (connection_t * con)

Definition at line 158 of file dmtp.c.

References con_write_bl().

5.147.1.6 void dmtp_hist (connection_t * con)

Definition at line 144 of file dmtp.c.

References con_write_bl().

5.147.1.7 void dmtp_init (connection_t * con)

The start of the protocol handler for the DMTP server.

Parameters:

con the new inbound DMTP client connection.

Returns:

This function returns no value.

Definition at line 175 of file dmtp.c.

References con_print(), con_reverse_enqueue(), dmtp_requeue(), st_char_get(), and st_length_int().

Referenced by protocol_enqueue().

5.147.1.8 void dmtp_invalid (connection_t * con)

A function that is executed when an invalid DMTP command is executed.

Returns:

This function returns no value.

Definition at line 52 of file dmtp.c.

References con_write_bl().

Referenced by dmtp_process().

5.147.1.9 void dmtp_mail (connection_t * con)

Specify the origin domain for a message in response to an DMTP MAIL command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 111 of file dmtp.c.

References con_write_bl().

5.147.1.10 void dmtp_mode (connection_t * con)

Definition at line 130 of file dmtp.c.

References `con_write_bl()`.

5.147.1.11 void dmtp_noop (connection_t * con)

Perform an DMTP NOOP (no-operation) command.

Note:

This command does essentially nothing and is mostly a way to keep connections alive without timing out due to inactivity.

Returns:

This function returns no value.

Definition at line 42 of file dmtp.c.

References `con_write_bl()`.

5.147.1.12 void dmtp_process (connection_t * con)

The main entry point in the DMTP server for processing commands issued by clients.

Parameters:

con a pointer to the connection object of the client issuing the DMTP command.

Returns:

This function returns no value.

Definition at line 48 of file commands.c.

References `command`, `command_t`, `con_read_line()`, `dmtp_commands`, `dmtp_compare()`, `dmtp_data()`, `dmtp_invalid()`, `dmtp_process()`, `dmtp_quit()`, `dmtp_requeue()`, `enqueue()`, `pl_char_get()`, `pl_empty()`, `pl_length_get()`, and `requeue()`.

Referenced by `dmtp_process()`, and `dmtp_requeue()`.

5.147.1.13 void dmtp_quit (connection_t * con)

Gracefully terminate an DMTP session, especially in response to an DMTP QUIT command.

Parameters:

the DMTP client connection to be terminated.

Returns:

This function returns no value.

Definition at line 65 of file dmtp.c.

References `con_destroy()`, `con_status()`, and `con_write_bl()`.

Referenced by `dmtp_process()`, and `dmtp_requeue()`.

5.147.1.14 void dmtplib_rcpt (connection_t * con)

Specify the destination domain for a message in response to an DMTP RCPT command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 100 of file dmtplib.c.

References con_write_bl().

5.147.1.15 void dmtplib_requeue (connection_t * con)

commands.c

Definition at line 31 of file commands.c.

References con_status(), dmtplib_process(), dmtplib_quit(), enqueue(), and status.

Referenced by dmtplib_data(), dmtplib_init(), and dmtplib_process().

5.147.1.16 void dmtplib_rset (connection_t * con)

Reset the DMTP session, in response to an DMTP RSET command.

Note:

This command clears any sender, recipient, and mail data, along with all buffers and state tables. The connection structure is reset to the same it was in immediately after the HELO/EHLO command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 88 of file dmtplib.c.

References con_write_bl(), and dmtplib_session_reset().

5.147.1.17 void dmtplib_session_destroy (connection_t * con)

Destroy the data associated with an DMTP session.

Parameters:

con the DMTP client connection to be destroyed.

Returns:

This function returns no value.

Definition at line 25 of file session.c.

Referenced by con_destroy().

5.147.1.18 void dmtp_session_reset (connection_t * con)

session.c session.c

Parameters:

con the DMTP client connection to be reset.

Returns:

This function returns no value.

Definition at line 15 of file session.c.

Referenced by dmtp_rset().

5.147.1.19 void dmtp_sgnt (connection_t * con)

Definition at line 137 of file dmtp.c.

References con_write_bl().

5.147.1.20 void dmtp_sort (void)

Sort the DMTP command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 26 of file commands.c.

References command_t, dmtp_commands, and dmtp_compare().

Referenced by protocol_init().

5.147.1.21 void dmtp_verb (connection_t * con)

Definition at line 164 of file dmtp.c.

References con_write_bl().

5.147.1.22 void dmtp_vrfy (connection_t * con)

Definition at line 151 of file dmtp.c.

References con_write_bl().

Functions

- [bool_t http_content_load_directory](#) ([int_t](#) template, [chr_t](#) *directory)
[content.c](#)
- [bool_t http_content_load_fonts](#) (void)
Load all fonts into the http server repository.
- [bool_t http_content_refresh](#) (void)
Refresh the stored contents of the web app templates, static content, and fonts directories.
- [bool_t http_content_start](#) (void)
Prime the the web app templates, static content, and fonts directories for future use.
- void [http_content_stop](#) (void)
Purge the http contents repository of stored fonts, templates, and static web pages.
- void [http_free_content](#) ([http_content_t](#) *page)
LOW: We should use basename() and dirname() to cleanup path strings.
- [http_content_t](#) * [http_get_static](#) ([stringer_t](#) *location)
Get a cached copy of a static web page.
- [http_content_t](#) * [http_get_template](#) ([chr_t](#) *location)
Return a template by location.
- [bool_t http_load_file](#) ([int_t](#) template, [chr_t](#) *filename)
Load file content into the http server repository.
- void [http_page_free](#) ([http_page_t](#) *page)
Free an http page object and all its underlying data.
- [http_page_t](#) * [http_page_get](#) ([chr_t](#) *location)
Get a template page and prepare its xml document root for use.
- void [http_data_free](#) ([http_data_t](#) *data)
[data.c](#)

- [http_data_t * http_data_get](#) ([connection_t *con](#), [HTTP_DATA](#) source, [chr_t *name](#))
Get a name/value pair associated with an http connection, by name.
- [http_data_t * http_data_header_parse_line](#) ([chr_t *buf](#), [size_t len](#))
Parse a data buffer into a http header name/value pair.
- [http_data_t * http_data_header_parse](#) ([connection_t *con](#))
Parse the current line of input from an http client connection into a http header name/value pair.
- [void http_data_value_decode](#) ([stringer_t *string](#))
Decode an escaped URI component into its original data.
- [int_t http_data_value_parse](#) ([connection_t *con](#), [HTTP_DATA](#) source, [placer_t](#) pair)
Parse a string containing a name/value pair; and place it in the specified connection's pairs holder.
- [void http_print_301](#) ([connection_t *con](#), [chr_t *location](#), [int_t](#) tls)
errors.c
- [void http_print_400](#) ([connection_t *con](#))
Return an HTTP 400 bad client request response to the client.
- [void http_print_403](#) ([connection_t *con](#))
Return an HTTP 403 access denied response to the client.
- [void http_print_404](#) ([connection_t *con](#))
Return an HTTP 404 location not found response to the client.
- [void http_print_405](#) ([connection_t *con](#))
Return an HTTP 405 method not allowed response to the client.
- [void http_print_500](#) ([connection_t *con](#))
Return an HTTP 500 internal server error response to the client.
- [void http_print_500_log](#) ([connection_t *con](#), [chr_t *logmsg](#))
Return an HTTP 500 internal server error response to the client, with additional logging information.
- [void http_print_501](#) ([connection_t *con](#))
Return an HTTP 501 method not implemented response to the client.
- [void http_body](#) ([connection_t *con](#))
http.c
- [void http_close](#) ([connection_t *con](#))
Close a connection corresponding to an http session.
- [void http_init](#) ([connection_t *con](#))
Handle a new http client connection.
- [void http_process](#) ([connection_t *con](#))
Process data sent by an http client.
- [void http_requeue](#) ([connection_t *con](#))
The main http server requeue entry point state machine for processing client data.

- void `http_parse_context` (`connection_t` *con, `stringer_t` *application, `stringer_t` *path)
Attempt to retrieve a connected user's associated session, by searching the cookie, the POST "session" variable, and the URL.
- void `http_parse_header` (`connection_t` *con)
Parse and process the current line of input from an http client connection as an http request header, storing data in the connection's `http.headers` member.
- void `http_parse_method` (`connection_t` *con)
Parse an http request and determine the request method and location.
- `int_t` `http_parse_origin` (`stringer_t` *s, `placer_t` *output)
Get the origin of a resource from a url.
- void `http_parse_pairs` (`connection_t` *con)
Parse all the GET and POST parameters present in an http client request, and store them with the connection.
- `placer_t` `get_header_value_noopt` (`stringer_t` *vstring)
Get the simple value of an http header, with any optional parameters stripped away.
- `placer_t` `get_header_opt` (`stringer_t` *vstring, `stringer_t` *optname)
Get the value of a named optional parameter from an http header value.
- `bool_t` `multipart_get_boundary` (`connection_t` *con, `placer_t` *output)
Get the boundary delimiter for a request by a connection specifying a Content-Type of multipart/form-data.
- void `http_response` (`connection_t` *con)
response.c
- `stringer_t` * `http_response_allow_cross` (`connection_t` *con)
- `stringer_t` * `http_response_connection` (`connection_t` *con, `int_t` force)
Get an appropriate value for the Connection header of an http response.
- `stringer_t` * `http_response_cookie` (`connection_t` *con)
- void `http_response_header` (`connection_t` *con, `int_t` status, `stringer_t` *type, `size_t` len)
Send a full set of http response headers to the remote client.
- void `http_response_options` (`connection_t` *con)
Return a response to an http OPTIONS request.
- `chr_t` * `http_response_status` (`int_t` status)
Get a descriptive string for a numerical http status code.
- void `http_session_destroy` (`connection_t` *con)
sessions.c
- void `http_session_reset` (`connection_t` *con)
Reset a client http connection to its original, uninitialized state.

5.149.1 Enumeration Type Documentation

5.149.1.1 anonymous enum

Enumerator:

HTTP_CONNECTION_CLOSE
HTTP_CONNECTION_NEUTRAL
HTTP_CONNECTION_KEEPALIVE

Definition at line 11 of file http.h.

5.149.1.2 anonymous enum

Enumerator:

HTTP_COOKIE_DELETE
HTTP_COOKIE_NEUTRAL
HTTP_COOKIE_SET

Definition at line 17 of file http.h.

5.149.1.3 anonymous enum

Enumerator:

HTTP_READY
HTTP_PARSE_HEADER
HTTP_PARSE_PAIRS
HTTP_PARSE_COOKIE
HTTP_READ_BODY
HTTP_RESPOND
HTTP_COMPLETE
HTTP_OK
HTTP_ERROR_400
HTTP_ERROR_401
HTTP_ERROR_403
HTTP_ERROR_404
HTTP_ERROR_405
HTTP_ERROR_422
HTTP_ERROR_500
HTTP_ERROR_501
HTTP_CLOSE

Definition at line 23 of file http.h.

5.149.2 Function Documentation

5.149.2.1 `placer_t get_header_opt (stringer_t * vstring, stringer_t * optname)`

Get the value of a named optional parameter from an http header value.

Note:

Only the value after the ":" in a header field is passed to this function (in other words, the header name is omitted).

Parameters:

vstring a managed string containing the single http header line value to be parsed.

optname a managed string with the name of the optional parameter to be found.

Returns:

a placer pointing to the named optional parameter of the specified http header value.

Definition at line 336 of file `parse.c`.

References `pl_null()`, `pl_trim_start()`, `placer_t`, `st_cmp_cs_eq()`, `tok_get_count_st()`, and `tok_get_st()`.

Referenced by `multipart_get_boundary()`, and `portal_upload()`.

5.149.2.2 `placer_t get_header_value_noopt (stringer_t * vstring)`

Get the simple value of an http header, with any optional parameters stripped away.

Note:

Only the value after the ":" in a header field is passed to this function (in other words, the header name is omitted).

Parameters:

vstring a managed string containing the single http header line value to be parsed.

Returns:

a placer pointing to the option-free header value of the specified input line.

Definition at line 313 of file `parse.c`.

References `pl_init()`, `placer_t`, `st_char_get()`, `st_length_get()`, `tok_get_count_st()`, and `tok_get_st()`.

Referenced by `http_parse_header()`, and `multipart_get_boundary()`.

5.149.2.3 `void http_body (connection_t * con)`

[http.c](#) `http.c`

Note:

Any request errors will be handled directly without returns. This function sets the value of the connection's `http.body` member.

Parameters:

con a pointer to the connection object of the remote http client.

Returns:

This function returns no value.

Definition at line 73 of file http.c.

References `con_read()`, `CONTIGUOUS`, `data`, `HEAP`, `magma_t::http`, `http_data_get()`, `HTTP_DATA_HEADER`, `HTTP_ERROR_400`, `HTTP_RESPOND`, `JOINTED`, `length`, `magma_t::log`, `log_pedantic`, `magma`, `MANAGED_T`, `MAPPED_T`, `size_conv_bl()`, `st_alloc_opts()`, `st_append_opts()`, `st_char_get()`, `st_cleanup`, `st_data_get()`, `st_dupe_opts()`, `st_empty`, `st_length_get()`, `st_length_int()`, and `http_data_t::value`.

Referenced by `http_requeue()`.

5.149.2.4 void http_close (connection_t * con)

Close a connection corresponding to an http session.

Returns:

This function returns no value.

Definition at line 14 of file http.c.

References `con_destroy()`.

Referenced by `http_process()`, and `http_requeue()`.

5.149.2.5 bool_t http_content_load_directory (int_t template, chr_t * directory)

[content.c](#) [content.c](#)

See also:

[http_load_file\(\)](#)

Parameters:

template a value specifying whether the specified directory contains templates or regular web content.

directory a null-terminated string specifying the pathname of the directory to be scanned recursively.

Returns:

0 on failure or 1 on success.

Definition at line 313 of file content.c.

References `http_content_load_directory()`, `http_load_file()`, `log_info`, `MEMORYBUF`, `NULLER`, `PLACER`, `st_char_get()`, `st_cmp_cs_ends()`, `st_cmp_cs_eq()`, `st_free()`, and `st_merge`.

Referenced by `http_content_load_directory()`, `http_content_refresh()`, and `http_content_start()`.

5.149.2.6 bool_t http_content_load_fonts (void)

Load all fonts into the http server repository.

Note:

This function will load all fonts of extension ".ttf" from the directory configured in [magma.http.fonts](#).

Returns:

0 on failure or 1 on success.

Definition at line 362 of file content.c.

References `magma_t::content`, `content`, `magma_t::http`, `inx_insert()`, `magma_t::log`, `log_info`, `log_pedantic`, `M_TYPE_UINT64`, `magma`, `MEMORYBUF`, `NULLER`, `PLACER`, `st_cmp_ci_ends()`, `st_cmp_cs_ends()`, `st_free()`, `st_merge`, `multi_t::u64`, and `multi_t::val`.

Referenced by `http_content_refresh()`, and `http_content_start()`.

5.149.2.7 bool_t http_content_refresh (void)

Refresh the stored contents of the web app templates, static content, and fonts directories.

Returns:

true if all content directories were successfully refreshed, or false on failure.

Definition at line 449 of file content.c.

References content, magma_t::http, http_content_load_directory(), http_content_load_fonts(), http_free_content(), inx_alloc(), inx_free(), M_INX_LINKED, magma, and st_free().

Referenced by signal_refresh().

5.149.2.8 bool_t http_content_start (void)

Prime the the web app templates, static content, and fonts directories for future use.

Note:

This function makes sure that the web templates, static content, and fonts directory have been properly set, and loads and caches their content for future use.

Returns:

true on success or false on failure.

Definition at line 407 of file content.c.

References content, magma_t::http, http_content_load_directory(), http_content_load_fonts(), http_free_content(), inx_alloc(), log_pedantic, M_INX_LINKED, magma, NULLER, PLACER, st_cmp_cs_ends(), and st_free().

Referenced by process_start().

5.149.2.9 void http_content_stop (void)

Purge the http contents repository of stored fonts, templates, and static web pages.

Returns:

This function returns no value.

Definition at line 435 of file content.c.

References content, and inx_cleanup().

Referenced by process_stop().

5.149.2.10 void http_data_free (http_data_t * data)

data.c data.c

Parameters:

data the http data object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file data.c.

References `mm_free()`, `http_data_t::name`, `st_cleanup`, and `http_data_t::value`.

Referenced by `http_data_value_parse()`, `http_parse_header()`, `http_parse_pairs()`, and `portal_upload()`.

5.149.2.11 `http_data_t* http_data_get (connection_t * con, HTTP_DATA source, chr_t * name)`

Get a name/value pair associated with an http connection, by name.

Note:

The name/value pairs searched can be supplied by a client through http request headers, or through GET or POST data.

Parameters:

con the connection object to be queried.

source the source of the client supplied value pair: `HTTP_DATA_GET`, `HTTP_DATA_POST` or `HTTP_DATA_ANY`.

name the name associated with the name/value pair to be retrieved.

Returns:

NULL on failure, or a pointer to the http name/value data pair requested on success.

TODO: We could just use the index find function.

Definition at line 34 of file data.c.

References `data`, `HTTP_DATA_ANY`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `http_data_t::name`, `NULLER`, `http_data_t::source`, and `st_cmp_ci_eq()`.

Referenced by `contact_business()`, `contact_print_form()`, `contact_process()`, `http_body()`, `http_response_allow_cross()`, `multipart_get_boundary()`, `register_business_step1()`, `register_business_step2()`, `register_process()`, and `teacher_process()`.

5.149.2.12 `http_data_t* http_data_header_parse (connection_t * con)`

Parse the current line of input from an http client connection into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 226 of file data.c.

References `http_data_header_parse_line()`, `st_char_get()`, and `st_length_get()`.

Referenced by `http_parse_header()`.

5.149.2.13 `http_data_t* http_data_header_parse_line (chr_t * buf, size_t len)`

Parse a data buffer into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 163 of file data.c.

References HTTP_DATA_HEADER, mm_alloc(), http_data_t::name, http_data_t::source, st_free(), st_import(), and http_data_t::value.

Referenced by http_data_header_parse(), and portal_upload().

5.149.2.14 void http_data_value_decode (stringer_t * *string*)

Decode an escaped URI component into its original data.

Note:

Since the un-escaped string will always be at least as small as the encoded value, the input managed string is transformed in place.

Parameters:

string a managed string containing the escaped URI data to be decoded.

Returns:

This function returns no value.

Definition at line 68 of file data.c.

References hex_decode_chr(), length, st_char_get(), st_length_get(), and st_length_set().

Referenced by http_data_value_parse().

5.149.2.15 int_t http_data_value_parse (connection_t * *con*, HTTP_DATA *source*, placer_t *pair*)

Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.

Note:

Each name/value pair is assumed to be delimited with a '=' character, and each half is URI-decoded before storage.

Parameters:

con a pointer to the connection object of the http client submitting the user data to be parsed.

source an HTTP_DATA value specifying the source of the name/value pair (can be HTTP_DATA_HEADER, HTTP_DATA_GET, or HTTP_DATA_POST).

pair a placer pointing to a string containing the name/value pair to be parsed.

Returns:

0 on general or parsing failure, or 1 if the specified input buffer was successfully parsed and stored.

Definition at line 111 of file data.c.

References CONTIGUOUS, data, HEAP, magma_t::http, http_data_free(), http_data_value_decode(), inx_insert(), magma_t::log, log_pedantic, M_TYPE_STRINGER, magma, MANAGED_T, mm_alloc(), http_data_t::name, pl_empty(), placer_t, http_data_t::source, multi_t::st, st_char_get(), st_dupe_opts(), st_free(), st_length_int(), tok_get_pl(), multi_t::val, and http_data_t::value.

Referenced by http_parse_pairs().

5.149.2.16 void http_free_content (http_content_t * *page*)

LOW: We should use basename() and dirname() to cleanup path strings. LOW: These functions should all be renamed to http_content_XXXX. The file and directory functions should be updated to use the x64/reentrant alternatives. Specifically open64/fstat64/readdir64_r. An update function that can be triggered with a SIGHUP would also be nice. Free a stored piece of http content and all its underlying data.

Parameters:

page a pointer to the loaded content page to be freed.

Returns:

This function returns no value.

Definition at line 27 of file content.c.

References http_content_t::location, mm_free(), http_content_t::resource, st_cleanup, and http_content_t::type.

Referenced by http_content_refresh(), http_content_start(), and http_load_file().

5.149.2.17 http_content_t* http_get_static (stringer_t * *location*)

Get a cached copy of a static web page.

Parameters:

location a pointer to a managed string containing the location of the requested resource.

Returns:

NULL on failure, or a pointer to an http content object with the contents of the requested resource on success.

Definition at line 67 of file content.c.

References content, inx_find(), M_TYPE_STRINGER, and http_content_t::type.

Referenced by http_response().

5.149.2.18 http_content_t* http_get_template (chr_t * *location*)

Return a template by location.

Parameters:

location a string specifying the location of the template.

Returns:

NULL on failure, or a pointer to an [http_content_t](#) object containing the template.

Definition at line 83 of file content.c.

References content, inx_find(), M_TYPE_STRINGER, NULLER, and http_content_t::type.

Referenced by http_page_get(), register_print_message(), register_print_step1(), register_print_step2(), and register_print_step3().

5.149.2.19 void http_init (connection_t * *con*)

Handle a new http client connection.

Parameters:

con a pointer to the http client connection that was just accepted.

Returns:

This function returns no value.

Definition at line 178 of file http.c.

References `con_reverse_enqueue()`, and `http_process()`.

Referenced by `protocol_enqueue()`.

5.149.2.20 bool_t http_load_file (int_t template, chr_t *filename)

Load file content into the http server repository.

Note:

Each file that is loaded will be cached for retrieval by http clients, with its mime type determined automatically. Any files passed as a template will have the ".template" extension trimmed from the end of its resource path, and any file named 'index.html' will be read as the default directory index path. Each file will also be added to its respective parent page or template inx holder.

Parameters:

template a value specifying whether or not the specified file is a template.

filename a null-terminated string specifying the pathname of the file to be loaded.

Returns:

0 on failure or 1 on success.

Definition at line 149 of file content.c.

References `magma_t::content`, `content`, `CONTIGUOUS`, `data`, `HEAP`, `magma_t::http`, `http_free_content()`, `inx_insert()`, `magma_t::log`, `log_info`, `log_pedantic`, `M_TYPE_STRINGER`, `magma`, `MANAGED_T`, `MEMORYBUF`, `mm_alloc()`, `ns_length_get()`, `NULLER`, `PLACER`, `multi_t::st`, `st_alloc()`, `st_char_get()`, `st_cmp_ci_ends()`, `st_cmp_cs_ends()`, `st_cmp_cs_eq()`, `st_dupe()`, `st_dupe_opts()`, `st_free()`, `st_import()`, `st_length_get()`, `st_length_int()`, `st_length_set()`, and `multi_t::val`.

Referenced by `http_content_load_directory()`.

5.149.2.21 void http_page_free (http_page_t *page)

Free an http page object and all its underlying data.

Parameters:

page a pointer to the http page object to be freed.

Definition at line 43 of file content.c.

References `http_page_t::doc_ctx`, `http_page_t::doc_obj`, `mm_free()`, `xml_free_doc()`, `xml_free_parser_ctx()`, `xml_free_xpath_ctx()`, and `http_page_t::xpath_ctx`.

Referenced by `contact_print_form()`, `contact_print_message()`, `http_page_get()`, `portal_print_login()`, `statistics_process()`, `teacher_print_form()`, and `teacher_print_message()`.

5.149.2.22 http_page_t* http_page_get (chr_t * location)

Get a template page and prepare its xml document root for use.

Note:

Each page is affixed with an xpath with a namespace after passing through the xml parser.

Parameters:

location a pointer to a null-terminated string with the pathname of the template to be returned.

Returns:

NULL on failure, or a pointer to the http page object of the requested template.

Definition at line 100 of file content.c.

References `http_page_t::content`, `http_page_t::doc_ctx`, `http_page_t::doc_obj`, `http_get_template()`, `http_page_free()`, `log_pedantic`, `mm_alloc()`, `http_content_t::resource`, `st_char_get()`, `st_length_get()`, `xml_create_doc()`, `xml_create_parser_ctx()`, `xml_create_xpath_ctx()`, `xml_xpath_set_namespace()`, and `http_page_t::xpath_ctx`.

Referenced by `contact_business_add_error()`, `contact_print_form()`, `contact_print_message()`, `portal_print_login()`, `statistics_process()`, `teacher_add_error()`, `teacher_print_form()`, and `teacher_print_message()`.

5.149.2.23 void http_parse_context (connection_t * con, stringer_t * application, stringer_t * path)

Attempt to retrieve a connected user's associated session, by searching the cookie, the POST "session" variable, and the URL. TODO: The header and body parsers need limits on how many headers/bytes they will accept. `parse.c`

Parameters:

con a pointer to the connection object to be queried for a session id.

application a managed string containing the application associated with the connection's pending request.

path a managed string containing the path associated with the connection's pending request.

Returns:

This function returns no value.

TODO: Develop better logic for handling cookies. Namely add the ability to forcibly trigger the Set-Cookie entity and if necessary delete the existing cookie.

Definition at line 115 of file `parse.c`.

References `HTTP_METHOD_POST`, `json_decref_d`, `json_loads_d`, `json_object_get_d`, `json_string_value_d`, `log_pedantic`, `NULLER`, `pl_init()`, `placer_t`, `sess_get()`, `st_char_get()`, `st_cmp_ci_starts()`, `st_length_get()`, `tok_get_pl()`, and `tok_get_st()`.

Referenced by `json_api_dispatch()`, `portal_endpoint()`, `portal_process()`, and `portal_upload()`.

5.149.2.24 void http_parse_header (connection_t * con)

Parse and process the current line of input from an http client connection as an http request header, storing data in the connection's `http.headers` member.

Note:

If no more http headers can be read, control is returned by setting the connection `http.mode` to `HTTP_RESPOND`. Special actions are taken to store the "Host", "User-Agent", "Cookie", and "Connection" headers.

Parameters:

con the connection object of the http client to be read, and to store the results of the operation.

Returns:

This function returns no value.

LOW: Should we bother to throw an error if con->http.connection isn't HTTP_CONNECTION_NEUTRAL?

Definition at line 177 of file parse.c.

References con_print(), CONTIGUOUS, data, get_header_value_noopt(), HEAP, magma_t::http, HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_KEEPALIVE, http_data_free(), http_data_header_parse(), HTTP_ERROR_500, HTTP_RESPOND, int32_conv_bl(), inx_alloc(), inx_insert(), magma_t::log, log_info, lower_st(), M_INX_LINKED, M_TYPE_STRINGER, magma, MANAGED_T, http_data_t::name, PLACER, placer_t, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_length_get(), st_length_int(), st_length_set(), st_search_cs(), multi_t::val, and http_data_t::value.

Referenced by http_process().

5.149.2.25 void http_parse_method (connection_t * con)

Parse an http request and determine the request method and location.

Note:

This function returns no value but sets the internal method, location, and state of the underlying connection object.

Parameters:

con the client connection making an http request.

Returns:

This function returns no value.

Definition at line 269 of file parse.c.

References CONTIGUOUS, HEAP, magma_t::http, HTTP_METHOD_CONNECT, HTTP_METHOD_DELETE, HTTP_METHOD_GET, HTTP_METHOD_HEAD, HTTP_METHOD_OPTIONS, HTTP_METHOD_POST, HTTP_METHOD_PUT, HTTP_METHOD_TRACE, HTTP_METHOD_UNSUPPORTED, HTTP_PARSE_HEADER, magma_t::log, log_info, magma, MANAGED_T, PLACER, placer_t, st_char_get(), st_cmp_ci_starts(), st_dupe_opts(), st_length_int(), tok_get_count_st(), and tok_get_pl().

Referenced by http_process().

5.149.2.26 int_t http_parse_origin (stringer_t * s, placer_t * output)

Get the origin of a resource from a url.

Note:

Usually we'll be give the value of the Origin header field to work with so we'll end up returning the entire string, but if we had to fall back and use the Referrer instead this should strip off the path portion.

Parameters:

s a managed string containing the url to be parsed.

output a pointer to a placer that will be set to point to the origin string inside the user-supplied url.

Returns:

0 on success or -1 on failure.

Definition at line 18 of file parse.c.

References `pl_init()`, `PLACER`, `st_cmp_ci_starts()`, `st_data_get()`, `st_empty_out()`, and `st_uchar_get()`.

Referenced by `http_response_allow_cross()`.

5.149.2.27 void http_parse_pairs (connection_t * con)

Parse all the GET and POST parameters present in an http client request, and store them with the connection.

Note:

All valid field parameters will be stored in the connection's `http.pairs` object.

Parameters:

con a pointer to the connection object generating the http requesting being processed.

Returns:

This function returns no value.

Definition at line 73 of file parse.c.

References `count`, `data`, `http_data_free()`, `HTTP_DATA_GET`, `HTTP_DATA_POST`, `http_data_value_parse()`, `HTTP_ERROR_500`, `inx_alloc()`, `M_INX_LINKED`, `pl_init()`, `PLACER`, `placer_t`, `st_char_get()`, `st_length_get()`, `st_search_cs()`, `tok_get_count_st()`, and `tok_get_st()`.

Referenced by `http_requeue()`, and `http_response()`.

5.149.2.28 void http_print_301 (connection_t * con, chr_t * location, int_t tls)

errors.c errors.c

Note:

SSL downgrades are not possible; in order for an ssl upgrade, `magma.web.ssl_redirect` must first be set.

Parameters:

con the client's http connection handle.

location the url to which the client will be redirected.

tls if 1, direct to `https://` else direct to `http://` address.

Returns:

This function returns no value.

LOW: This function should probably move to the response file and be updated to use the cookie/xss helper functions.

Definition at line 18 of file errors.c.

References `con_print()`, `con_secure()`, `HTTP_COMPLETE`, `http_print_403()`, `http_print_500()`, `log_pedantic`, `magma`, `st_char_get()`, `st_cleanup`, `st_dupe()`, `st_free()`, `st_length_int()`, `st_merge`, `magma_t::tls_redirect`, and `magma_t::web`.

Referenced by `contact_process()`, `portal_endpoint()`, `portal_process()`, `portal_upload()`, `register_process()`, and `teacher_process()`.

5.149.2.29 void http_print_400 (connection_t * con)

Return an HTTP 400 bad client request response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 80 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.149.2.30 void http_print_403 (connection_t * con)

Return an HTTP 403 access denied response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 94 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_print_301()`, and `http_requeue()`.

5.149.2.31 void http_print_404 (connection_t * con)

Return an HTTP 404 location not found response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 108 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.149.2.32 void http_print_405 (connection_t * con)

Return an HTTP 405 method not allowed response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 122 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.149.2.33 void http_print_500 (connection_t * con)

Return an HTTP 500 internal server error response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 136 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, `log_options`, `M_LOG_CRITICAL`, `M_LOG_STACK_TRACE`, and `PLACER`.

Referenced by `contact_print_message()`, `http_print_301()`, `http_requeue()`, `portal_print_login()`, `register_print_captcha()`, `register_print_message()`, `register_print_step3()`, `statistics_process()`, `teacher_print_form()`, and `teacher_print_message()`.

5.149.2.34 void http_print_500_log (connection_t * con, chr_t * logmsg)

Return an HTTP 500 internal server error response to the client, with additional logging information.

Parameters:

con the client's http connection handle.

logmsg a pointer to a null-terminated string with an message describing the cause of the http 500 error.

Returns:

This function returns no value.

Definition at line 154 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, `log_options`, `M_LOG_CRITICAL`, and `PLACER`.

Referenced by `contact_print_message()`, `register_print_step1()`, and `register_print_step2()`.

5.149.2.35 void http_print_501 (connection_t * con)

Return an HTTP 501 method not implemented response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 169 of file errors.c.

References `con_write_st()`, `HTTP_CONNECTION_CLOSE`, `http_response_header()`, and `PLACER`.

Referenced by `http_requeue()`.

5.149.2.36 void http_process (connection_t * con)

Process data sent by an http client.

Note:

This is performed in two stages: first read the http method with [http_parse_method\(\)](#), then transfer control to [http_parse_header\(\)](#). If a failure occurs reading a line of data, or too many protocol violations occur, [http_close\(\)](#) is called to drop the connection.

Parameters:

con the connection object from which to read data.

Returns:

This function returns no value.

Definition at line 137 of file http.c.

References [con_read_line\(\)](#), [enqueue\(\)](#), [http_close\(\)](#), [http_parse_header\(\)](#), [HTTP_PARSE_HEADER](#), [http_parse_method\(\)](#), [http_process\(\)](#), [HTTP_READY](#), [http_requeue\(\)](#), [log_pedantic](#), [pl_empty\(\)](#), and [requeue\(\)](#).

Referenced by [http_init\(\)](#), [http_process\(\)](#), and [http_requeue\(\)](#).

5.149.2.37 void http_requeue (connection_t * con)

The main http server requeue entry point state machine for processing client data.

Returns:

This function returns no value.

Definition at line 24 of file http.c.

References [con_status\(\)](#), [enqueue\(\)](#), [http_body\(\)](#), [http_close\(\)](#), [HTTP_CLOSE](#), [HTTP_COMPLETE](#), [HTTP_ERROR_400](#), [HTTP_ERROR_403](#), [HTTP_ERROR_404](#), [HTTP_ERROR_405](#), [HTTP_ERROR_500](#), [HTTP_ERROR_501](#), [http_parse_pairs\(\)](#), [HTTP_PARSE_PAIRS](#), [http_print_400\(\)](#), [http_print_403\(\)](#), [http_print_404\(\)](#), [http_print_405\(\)](#), [http_print_500\(\)](#), [http_print_501\(\)](#), [http_process\(\)](#), [HTTP_READ_BODY](#), [http_requeue\(\)](#), [HTTP_RESPOND](#), [http_response\(\)](#), [http_session_reset\(\)](#), [requeue\(\)](#), and [status](#).

Referenced by [http_process\(\)](#), and [http_requeue\(\)](#).

5.149.2.38 void http_response (connection_t * con)

[response.c](#) [response.c](#)

Note:

The following http methods aren't supported: PUT, DELETE, HEAD, TRACE, and CONNECT. The http server will first attempt to retrieve the requested url as a static page; otherwise the following special locations are supported: /portal, /portal/camel, /register, /contact, /report_abuse, /teacher, and /statistics.

Returns:

This function returns no value.

Definition at line 419 of file response.c.

References [magma_t::abuse](#), [magma_t::admin](#), [con_write_st\(\)](#), [magma_t::contact](#), [contact_process\(\)](#), [content](#), [HTTP_ERROR_403](#), [HTTP_ERROR_404](#), [HTTP_ERROR_405](#), [HTTP_ERROR_500](#), [HTTP_ERROR_501](#), [http_get_static\(\)](#), [HTTP_METHOD_CONNECT](#), [HTTP_METHOD_DELETE](#), [HTTP_METHOD_HEAD](#), [HTTP_METHOD_OPTIONS](#), [HTTP_METHOD_POST](#), [HTTP_METHOD_PUT](#),

HTTP_METHOD_TRACE, HTTP_METHOD_UNSUPPORTED, http_parse_pairs(), HTTP_READ_BODY, HTTP_RESPOND, http_response_header(), http_response_options(), json_api_dispatch(), magma, NULLER, PLACER, portal_endpoint(), portal_process(), portal_upload(), register_process(), magma_t::registration, http_content_t::resource, st_cmp_ci_starts(), st_cmp_cs_eq(), st_cmp_cs_starts(), st_length_get(), magma_t::statistics, statistics_process(), teacher_process(), http_content_t::type, and magma_t::web.

5.149.2.39 stringer_t* http_response_allow_cross (connection_t * con)

Definition at line 245 of file response.c.

References http_data_get(), HTTP_DATA_HEADER, http_parse_origin(), MANAGEDBUF, PLACER, placer_t, st_append, st_char_get(), st_cmp_ci_eq(), st_length_int(), st_quick(), upper_st(), and http_data_t::value.

Referenced by http_response_header(), and http_response_options().

5.149.2.40 stringer_t* http_response_connection (connection_t * con, int_t force)

Get an appropriate value for the Connection header of an http response.

Note:

If magma.http.close was set in the configuration options, the connection will be closed immediately.

Parameters:

con a pointer to the connection object of the outgoing response.

force either HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_NEUTRAL, or HTTP_CONNECTION_KEEPALIVE. HTTP_CONNECTION_CLOSE will result in the connection being terminated immediately, HTTP_CONNECTION_KEEPALIVE will result in a "Connection: keep-alive" response, and HTTP_CONNECTION_NEUTRAL will not result in any output.

Returns:

a pointer to a managed string containing the http Connection header field that should be used for the response.

Definition at line 288 of file response.c.

References CONTIGUOUS, HEAP, magma_t::http, HTTP_CLOSE, HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_KEEPALIVE, magma, MANAGED_T, PLACER, and st_dupe_opts().

Referenced by http_response_header(), and http_response_options().

5.149.2.41 stringer_t* http_response_cookie (connection_t * con)

Definition at line 190 of file response.c.

References con_secure(), HEAP, HTTP_COOKIE_DELETE, HTTP_COOKIE_SET, JOINED, MANAGED_T, MANAGEDBUF, PLACER, st_append, st_aprint_opts(), st_char_get(), st_length_int(), st_quick(), and time_print_gmt().

Referenced by http_response_header().

5.149.2.42 void http_response_header (connection_t * con, int_t status, stringer_t * type, size_t len)

Send a full set of http response headers to the remote client.

Note:

If the mode is HTTP_RESPOND it will be changed to HTTP_COMPLETE, to tell the http requeue function to reset the context and enqueue request processor.

Parameters:

con a pointer to the connection object across which the response will be sent.
status an integer containing the http status code for the response.
type a managed string containing the value of the Content-Type header.
len the value of the Content-Length header.

Returns:

This function returns no value.

Definition at line 364 of file response.c.

References `con_print()`, `magma_t::http`, `HTTP_COMPLETE`, `HTTP_CONNECTION_NEUTRAL`, `HTTP_RESPOND`, `http_response_allow_cross()`, `http_response_connection()`, `http_response_cookie()`, `http_response_status()`, `magma`, `MANAGEDBUF`, `mm_wipe()`, `st_char_get()`, `st_cleanup`, `st_length_int()`, and `time_print_gmt()`.

Referenced by `api_response()`, `contact_print_form()`, `contact_print_message()`, `http_print_400()`, `http_print_403()`, `http_print_404()`, `http_print_405()`, `http_print_500()`, `http_print_500_log()`, `http_print_501()`, `http_response()`, `portal_endpoint()`, `portal_endpoint_attachments_progress()`, `portal_endpoint_error()`, `portal_endpoint_response()`, `portal_endpoint_search()`, `portal_print_login()`, `register_print_message()`, `register_print_step1()`, `register_print_step2()`, `register_print_step3()`, `statistics_process()`, and `teacher_print_form()`.

5.149.2.43 void http_response_options (connection_t * con)

Return a response to an http OPTIONS request.

Parameters:

con the client connection which made the OPTIONS request.

Returns:

This function returns no value.

LOW: I couldn't find a definitive answer about whether the OPTION response should always return a Content-Type of text/plain or use the Content-Type associated with the location provided in the request.

Definition at line 316 of file response.c.

References `build_stamp()`, `build_version()`, `con_print()`, `magma_t::http`, `HTTP_COMPLETE`, `HTTP_CONNECTION_NEUTRAL`, `HTTP_RESPOND`, `http_response_allow_cross()`, `http_response_connection()`, `magma`, `MANAGEDBUF`, `mm_wipe()`, `st_char_get()`, `st_cleanup`, `st_length_int()`, and `time_print_gmt()`.

Referenced by `http_response()`.

5.149.2.44 chr_t* http_response_status (int_t status)

Get a descriptive string for a numerical http status code.

Parameters:

status the value of the http status code to be looked up.

Returns:

NULL on failure, or a pointer to a null-terminated string containing a description of the specified http status code on success.

Definition at line 15 of file response.c.

References `log_pedantic`.

Referenced by `http_response_header()`.

5.149.2.45 void http_session_destroy (connection_t * con)

sessions.c sessions.c

Parameters:

con the connection object to have its http session destroyed.

Returns:

This function returns no value.

Definition at line 77 of file sessions.c.

References `http_session_reset()`.

Referenced by `con_destroy()`.

5.149.2.46 void http_session_reset (connection_t * con)

Reset a client http connection to its original, uninitialized state.

Parameters:

con the connection object to have its http session state reset.

Returns:

This function returns no value.

Definition at line 15 of file sessions.c.

References `HTTP_CLOSE`, `HTTP_CONNECTION_CLOSE`, `HTTP_CONNECTION_NEUTRAL`, `HTTP_MERGED`, `HTTP_METHOD_NONE`, `HTTP_PORTAL`, `HTTP_READY`, `inx_cleanup()`, `json_decref_d`, `sess_release()`, and `st_cleanup`.

Referenced by `http_requeue()`, and `http_session_destroy()`.

5.149.2.47 bool_t multipart_get_boundary (connection_t * con, placer_t * output)

Get the boundary delimiter for a request by a connection specifying a Content-Type of multipart/form-data.

Parameters:

con a pointer to the connection object of the client making the http request.

output a pointer to the address of a managed string that will receive a copy of the value of the boundary string on success.

Returns:

true on success or false on failure.

Definition at line 373 of file parse.c.

References `get_header_opt()`, `get_header_value_noopt()`, `http_data_get()`, `HTTP_DATA_HEADER`, `NULLER`, `pl_empty()`, `placer_t`, and `http_data_t::value`.

Referenced by `portal_upload()`.

- `int_t imap_folder_compare (stringer_t *name, stringer_t *compare)`
- `int_t imap_folder_create (uint64_t usernum, inx_t *folders, stringer_t *name)`

Create a new imap folder.

- `stringer_t * imap_folder_name_escaped (inx_t *folders, meta_folder_t *active)`

Get an imap folder's escaped name.

- `int_t imap_folder_remove (uint64_t usernum, inx_t *folders, inx_t *messages, stringer_t *name)`

Remove an imap folder, both in memory and on the database.

- `int_t imap_folder_rename (uint64_t usernum, inx_t *folders, stringer_t *original, stringer_t *rename)`

Rename an imap folder.

- `int_t imap_folder_status (inx_t *folders, inx_t *messages, stringer_t *name, imap_folder_status_t *status)`

Get the status of a folder.

- `inx_t * imap_narrow_folders (inx_t *folders, stringer_t *reference, stringer_t *mailbox)`
- `uint64_t imap_next_folder_order (inx_t *folders, uint64_t parent)`

Get the next order value for an imap folder.

- `bool_t imap_valid_folder_name (stringer_t *name)`

Check to see if a name is a valid imap folder name.

- `void imap_append (connection_t *con)`

imap.c

- `void imap_capability (connection_t *con)`

Display the capability string for the IMAP server.

- void [imap_check](#) ([connection_t](#) *con)
- void [imap_close](#) ([connection_t](#) *con)
- void [imap_copy](#) ([connection_t](#) *con)
- void [imap_create](#) ([connection_t](#) *con)

Create a new IMAP folder in response to the IMAP "CREATE" command.

- void [imap_delete](#) ([connection_t](#) *con)

Handle the IMAP "DELETE" command and delete the specified IMAP folder.

- void [imap_examine](#) ([connection_t](#) *con)
- void [imap_expunge](#) ([connection_t](#) *con)
- void [imap_fetch](#) ([connection_t](#) *con)
- void [imap_id](#) ([connection_t](#) *con)
- void [imap_idle](#) ([connection_t](#) *con)
- void [imap_init](#) ([connection_t](#) *con)

The main IMAP entry point for all inbound client connections, as dispatched by the generic protocol handler (display banner greeting).

- void [imap_invalid](#) ([connection_t](#) *con)

Respond to an invalid IMAP command from a client.

- void [imap_list](#) ([connection_t](#) *con)
- void [imap_login](#) ([connection_t](#) *con)

Attempt to perform a user login on an IMAP client connection.

- void [imap_logout](#) ([connection_t](#) *con)

Terminate an IMAP session gracefully with a "BYE" message and destroy the underlying connection.

- void [imap_lsub](#) ([connection_t](#) *con)
- void [imap_noop](#) ([connection_t](#) *con)

- `void imap_parse_address_put (stringer_t *buffer, chr_t c)`
LOW: Do we need an `imap_parse_address_group()` function?
- `int_t imap_command_parser (connection_t *con)`
parse.c
- `imap_arguments_t * imap_get_ar_ar (imap_arguments_t *array, size_t element)`
Return the value of a specified object in an array as an imap arguments array.
- `void * imap_get_ptr (imap_arguments_t *array, size_t element)`
Return the value of a specified object in an array as a generic pointer.
- `stringer_t * imap_get_st_ar (imap_arguments_t *array, size_t element)`
Return the value of a specified object in an array as a managed string.
- `int_t imap_get_type_ar (imap_arguments_t *array, size_t element)`
TODO: The logic here is just plain ugly. Specifically the logic used to read from the network and advance the buffers.
- `int_t imap_parse_arguments (connection_t *con, chr_t **start, size_t *length)`
Parse a chunk of input into an array of IMAP arguments.
- `int_t imap_parse_array (int_t recursion, connection_t *con, imap_arguments_t **array, chr_t **start, size_t *length)`
Extract the contents of an array argument and advance the position of the parser stream.
- `int_t imap_parse_astring (stringer_t **output, chr_t **start, size_t *length)`
Extract the contents of an atomic string and advance the position of the parser stream.
- `int_t imap_parse_literal (connection_t *con, stringer_t **output, chr_t **start, size_t *length)`
Extract the contents of a literal string and advance the position of the parser stream.
- `int_t imap_parse_nstring (stringer_t **output, chr_t **start, size_t *length, chr_t type)`
- `int_t imap_parse_qstring (stringer_t **output, chr_t **start, size_t *length)`
Extract the contents of a quoted string and advance the position of the parser stream.
- `stringer_t * imap_range_build (size_t length, uint64_t *numbers)`
range.c
- `int_t imap_search_flag (uint32_t status, uint32_t flag, int_t has)`
search.c
- `inx_t * imap_search_messages (connection_t *con)`

Definition at line 1087 of file `imap.c`.

References `ar_length_get()`, `con_print()`, `imap_message_expunge()`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `MAIL_STATUS_DELETED`, `MAIL_STATUS_RECENT`, `meta_message_t`, `meta_messages_update_sequences()`, `meta_user_rlock()`, `meta_user_unlock()`, `meta_user_wlock()`, `OBJECT_MESSAGES`, `serial_get()`, `serial_increment()`, `st_char_get()`, `st_length_int()`, `user_lock()`, and `user_unlock()`.

5.151.2.8 `int_t imap_command_parser (connection_t * con)`

`parse.c` `parse.c`

Note:

This function updates the protocol-specific IMAP structure with parsed values for the session's tag, command, and arguments fields. Special handling is performed for any command that is preceded by a "UID" prefix.

Parameters:

con the IMAP client connection issuing the command.

Returns:

1 on success or < 0 on error. -1: the tag could not be read. -2: the IMAP command could not be read. -3: the arguments to the IMAP command could not be read.

Definition at line 886 of file `parse.c`.

References `ar_free()`, `magma_t::imap`, `imap_command_log_safe()`, `imap_parse_arguments()`, `imap_parse_astring()`, `length`, `magma_t::log`, `log_pedantic`, `magma`, `PLACER`, `st_cleanup`, `st_cmp_ci_eq()`, `st_data_get()`, `st_free()`, and `st_length_get()`.

Referenced by `imap_process()`.

5.151.2.9 int_t imap_compare (const void * *compare*, const void * *command*)

commands.c commands.c

Note:

This is an internal function used to sort imap commands and search for them.

Parameters:

compare a pointer to the first command to be compared.

command a pointer to the second command to be compared.

Returns:

-1 if *compare* < *command*, 1 if *command* < *compare*, or 0 if the two commands are equal.

Definition at line 18 of file commands.c.

References command_t, PLACER, st_cmp_ci_eq(), and st_cmp_ci_starts().

Referenced by imap_process(), and imap_sort().

5.151.2.10 void imap_copy (connection_t * *con*)

Definition at line 1296 of file imap.c.

References ar_length_get(), con_print(), count, IMAP_ARGUMENT_TYPE_ARRAY, imap_get_st_ar(), imap_get_type_ar(), imap_message_copier(), imap_narrow_messages(), imap_range_build(), imap_valid_sequence(), inx_count(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), inx_t, log_pedantic, MAIL_STATUS_RECENT, meta_folder_t, meta_folders_by_name(), meta_message_t, meta_user_unlock(), meta_user_wlock(), mm_alloc(), mm_free(), st_char_get(), st_length_get(), st_length_int(), user_lock(), and user_unlock().

5.151.2.11 int_t imap_count_folder_levels (stringer_t * *name*)

folders.c folders.c

Note:

The smallest possible node level value is 1.

Parameters:

name a managed string containing the name of the imap folder.

Returns:

0 on failure, or the number of node levels indicated by the specified imap folder name, on success.

Definition at line 218 of file folders.c.

References IMAP_FOLDER_RECURSION_LMIIT, log_pedantic, and st_empty_out().

Referenced by imap_folder_create(), and imap_folder_rename().

5.151.2.12 void imap_create (connection_t * *con*)

Create a new IMAP folder in response to the IMAP "CREATE" command.

See also:

[imap_folder_create\(\)](#)

Parameters:

con the connection across which the folder creation request was made.

Returns:

This function returns no value.

Definition at line 471 of file imap.c.

References [ar_length_get\(\)](#), [con_print\(\)](#), [FOLDER_LENGTH_LIMIT](#), [IMAP_ARGUMENT_TYPE_ARRAY](#), [imap_folder_create\(\)](#), [IMAP_FOLDER_RECURSION_LMIIT](#), [imap_get_st_ar\(\)](#), [imap_get_type_ar\(\)](#), [meta_user_unlock\(\)](#), [meta_user_wlock\(\)](#), [OBJECT_FOLDERS](#), [serial_get\(\)](#), [serial_increment\(\)](#), [st_char_get\(\)](#), and [st_length_int\(\)](#).

5.151.2.13 void imap_delete (connection_t * con)

Handle the IMAP "DELETE" command and delete the specified IMAP folder.

See also:

[imap_folder_remove\(\)](#)

Parameters:

con a pointer to the connection object of the IMAP session generating the delete request.

Returns:

This function returns no value.

Definition at line 538 of file imap.c.

References [ar_length_get\(\)](#), [con_print\(\)](#), [IMAP_ARGUMENT_TYPE_ARRAY](#), [imap_folder_remove\(\)](#), [imap_get_st_ar\(\)](#), [imap_get_type_ar\(\)](#), [meta_user_unlock\(\)](#), [meta_user_wlock\(\)](#), [OBJECT_FOLDERS](#), [serial_get\(\)](#), [serial_increment\(\)](#), [st_char_get\(\)](#), and [st_length_int\(\)](#).

5.151.2.14 inx_t* imap_duplicate_messages (inx_t * messages)

[fetch.c](#) [fetch.c](#)

See also:

[meta_message_dupe\(\)](#)

Parameters:

messages a collection of meta message objects to be duplicated.

Returns:

the copied collection of meta messages on success, or NULL on failure.

Definition at line 1240 of file fetch.c.

References [inx_alloc\(\)](#), [inx_append\(\)](#), [inx_cursor_alloc\(\)](#), [inx_cursor_free\(\)](#), [inx_cursor_t](#), [inx_cursor_value_next\(\)](#), [inx_free\(\)](#), [inx_t](#), [log_error](#), [M_INX_LINKED](#), [M_TYPE_UINT64](#), [meta_message_dupe\(\)](#), [meta_message_free\(\)](#), [meta_message_t](#), [multi_t::u64](#), and [multi_t::val](#).

5.151.2.38 `int_t imap_folder_create (uint64_t usernum, inx_t * folders, stringer_t * name)`

Create a new imap folder.

Note:

If they don't already exist, any parent folders specified in the fully qualified folder name will automatically be created first.

Parameters:

userid the numerical id of the user to whom the new imap folder will belong.
folders an inx holder containing the set of folders into which the new imap folder will be inserted.
name a managed string containing the fully qualified name of the new imap folder to be created.

Returns:

1 on success or ≤ 0 on failure. 0: An invalid parameter was passed to the function, or an internal failure occurred. -1: The specified new folder name was invalid. -2: The node depth of the new folder is too large (imap folder recursion limit reached [IMAP_FOLDER_RECURSION_LMIIT]). -3: Special folder "Inbox" cannot contain subfolders. -4: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks. -5: The specified folder name already exists.

Definition at line 264 of file folders.c.

References CONTIGUOUS, FOLDER_LENGTH_LIMIT, HEAP, imap_count_folder_levels(), IMAP_FOLDER_RECURSION_LMIIT, imap_next_folder_order(), imap_valid_folder_name(), inx_insert(), log_pedantic, M_TYPE_UINT64, MANAGED_T, meta_data_insert_folder(), meta_folder_t, meta_folders_by_name(), mm_alloc(), mm_copy(), mm_free(), pl_data_get(), pl_length_get(), PLACER, placer_t, st_cleanup, st_cmp_ci_eq(), st_dupe(), st_dupe_opts(), st_free(), st_merge, st_replace(), tok_get_st(), multi_t::u64, and multi_t::val.

Referenced by imap_create(), imap_subscribe(), and portal_folder_mail_add().

5.151.2.39 stringer_t* imap_folder_name_escaped (inx_t * folders, meta_folder_t * active)

Get an imap folder's escaped name. TODO: Since the Portal needs access to some of these folder manipulation functions the common logic should be extracted and moved into the folder object interface.

Parameters:

folders an inx holder containing the ancestor folders of the specified imap folder.
active a pointer to the meta folder object of the folder to have its name escaped.

Returns:

NULL on failure, or a pointer to a managed string containing the escaped name of the specified imap folder on success.

Definition at line 19 of file folders.c.

References meta_folders_name(), PLACER, st_free(), st_merge, and st_replace().

Referenced by imap_list(), and imap_lsub().

5.151.2.40 int_t imap_folder_remove (uint64_t userid, inx_t * folders, inx_t * messages, stringer_t * name)

Remove an imap folder, both in memory and on the database.

Note:

Any child messages of the specified folder will be deleted, but if it has child folders, the folder will not be deleted. The function also protects the special "Inbox" folder from deletion.

Parameters:

userid the numerical id of the user that owns the imap folder to be deleted.
folders an inx holder containing a collection of folders for looking up the specified imap folder by name.

messages an inx holder containing a collection of messages for looking up the contents of the specified imap folder.

name a managed string containing the name of the imap folder to be deleted.

Returns:

<= 0 on failure, or 1 on success. 0: General failure or if there was an error removing the folder from the database. -1: The specified folder name was invalid. -2: Removal failed because the "Inbox" folder was specified. -3: The specified folder could not be found.

Definition at line 412 of file folders.c.

References `imap_valid_folder_name()`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `inx_delete()`, `log_error`, `log_pedantic`, `M_TYPE_UINT64`, `mail_remove_message()`, `meta_data_delete_folder()`, `meta_folder_t`, `meta_folders_by_name()`, `meta_folders_children()`, `meta_message_t`, `PLACER`, `placer_t`, `st_cmp_ci_eq()`, `tok_get_st()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `imap_delete()`, and `portal_folder_mail_remove()`.

5.151.2.41 `int_t imap_folder_rename(uint64_t usernum, inx_t *folders, stringer_t *original, stringer_t *rename)`

Rename an imap folder.

Note:

Any parent folder components of the folder's fully qualified name will be created if they do not already exist.

Parameters:

usernum the numerical id of the user requesting the folder renaming.

folders an inx holder containing the folders to be searched for the folder specified to be renamed.

original a managed string containing the original name of the folder to be renamed.

rename a managed string containing the new name of the specified folder.

Returns:

1 on success or 0 or less on failure. 0: One of the parameters passed to the function was invalid, or there was a memory allocation failure. -1: Either the original or new folder name was invalid. -2: Was unable to rename the "Inbox" folder. -3: The specified imap folder did not exist. -4: Either the original or new name exceeded the imap folder recursion limit. -5: A folder already exists with the new folder name. -6: A segment of the folder name was larger than `FOLDER_LENGTH_LIMIT` (16 bytes).

Definition at line 488 of file folders.c.

References `CONTIGUOUS`, `FOLDER_LENGTH_LIMIT`, `HEAP`, `imap_count_folder_levels()`, `IMAP_FOLDER_RECURSION_LMIIT`, `imap_next_folder_order()`, `imap_valid_folder_name()`, `inx_insert()`, `log_error`, `log_pedantic`, `M_TYPE_UINT64`, `MANAGED_T`, `meta_data_insert_folder()`, `meta_data_update_folder_name()`, `meta_folder_t`, `meta_folders_by_name()`, `mm_alloc()`, `mm_copy()`, `mm_free()`, `mm_wipe()`, `pl_data_get()`, `pl_length_get()`, `PLACER`, `placer_t`, `st_cleanup`, `st_cmp_ci_eq()`, `st_dupe()`, `st_dupe_opts()`, `st_free()`, `st_merge`, `st_replace()`, `tok_get_st()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `imap_rename()`, and `portal_endpoint_folders_rename()`.

5.151.2.42 `int_t imap_folder_status(inx_t *folders, inx_t *messages, stringer_t *name, imap_folder_status_t *status)`

Get the status of a folder.

Note:

This function will count the number of messages in a folder, as well as the number of messages marked recent or unseen, as well as the numerical id of the first message in the folder and the `UIDNEXT` of the specified folder.

Parameters:

folders an inx holder containing a list of folders to be searched for the specified folder.

messages an inx holder containing a complete list of a user's messages to be examined for gathering statistics.

name a managed string containing the name of the imap folder to be queried.

status a pointer to an imap folder status object to receive the folder's status information.

Returns:

1 on success or ≤ 0 on failure. 0: General failure. -1: The specified folder name was invalid. -2: The folder did not exist.

Definition at line 678 of file folders.c.

References `imap_folder_status_t::first`, `imap_folder_status_t::foldernum`, `imap_valid_folder_name()`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `MAIL_STATUS_RECENT`, `MAIL_STATUS_SEEN`, `imap_folder_status_t::messages`, `meta_folder_t`, `meta_folders_by_name()`, `meta_message_t`, `mm_wipe()`, `imap_folder_status_t::recent`, `imap_folder_status_t::uidnext`, and `imap_folder_status_t::unseen`.

Referenced by `imap_examine()`, `imap_select()`, and `imap_status()`.

5.151.2.43 `imap_arguments_t* imap_get_ar_ar (imap_arguments_t * array, size_t element)`

Return the value of a specified object in an array as an imap arguments array.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value as an imap arguments array on success.

Definition at line 100 of file parse.c.

References `ar_length_get()`, `IMAP_ARGUMENT_TYPE_ARRAY`, `imap_get_type_ar()`, and `log_pedantic`.

5.151.2.45 `void* imap_get_ptr (imap_arguments_t * array, size_t element)`

Return the value of a specified object in an array as a generic pointer.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value on success.

Definition at line 46 of file parse.c.

References `ar_length_get()`, and `log_pedantic`.

Referenced by `imap_append()`, `imap_fetch_body()`, and `imap_store()`.

5.151.2.46 stringer_t* imap_get_st_ar (imap_arguments_t * array, size_t element)

Return the value of a specified object in an array as a managed string.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value as a managed string on success.

Definition at line 71 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_ARRAY, imap_get_type_ar(), and log_pedantic.

5.151.2.47 int_t imap_get_type_ar (imap_arguments_t * array, size_t element)

TODO: The logic here is just plain ugly. Specifically the logic used to read from the network and advance the buffers. Get the type code for a specified object in an array.

Note:

Valid return values include IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_ASTRING, IMAP_ARGUMENT_TYPE_QSTRING, IMAP_ARGUMENT_TYPE_NSTRING, and IMAP_ARGUMENT_TYPE_LITERAL.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

IMAP_ARGUMENT_TYPE_EMPTY on failure, or the element type code of the specified object on success.

Definition at line 20 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_EMPTY, and log_pedantic.

5.151.2.53 void imap_login (connection_t * con)

Attempt to perform a user login on an IMAP client connection.

Parameters:

con a pointer to the connection object of the remote session.

Returns:

This function returns no value.

Definition at line 106 of file imap.c.

References `ar_length_get()`, `auth_free()`, `AUTH_LOCK_ABUSE`, `AUTH_LOCK_ADMIN`, `AUTH_LOCK_EXPIRED`, `AUTH_LOCK_USER`, `auth_login()`, `cache_decrement()`, `cache_increment()`, `con_addr_presentation()`, `con_addr_subnet()`, `con_print()`, `con_secure()`, `IMAP_ARGUMENT_TYPE_ARRAY`, `imap_get_st_ar()`, `imap_get_type_ar()`, `inx_count()`, `auth_t::keys`, `lock_get()`, `lock_release()`, `auth_t::locked`, `log_info`, `MANAGEDBUF`, `auth_t::master`, `meta_data_update_log()`, `meta_get()`, `META_GET_FOLDERS`, `META_GET_KEYS`, `META_GET_MESSAGES`, `meta_inx_remove()`, `META_PROTOCOL_IMAP`, `META_USER_ENCRYPT_DATA`, `meta_user_rlock()`, `META_USER_TLS`, `meta_user_unlock()`, `auth_t::salt`, `auth_t::seasoning`, `st_char_get()`, `st_dupe()`, `st_free()`, `st_length_int()`, `st_populated`, `st_quick()`, `auth_t::status`, `time_datestamp()`, `auth_t::tokens`, `auth_t::username`, `auth_t::usernum`, and `auth_t::verification`.

5.151.2.54 `void imap_logout (connection_t * con)`

Terminate an IMAP session gracefully with a "BYE" message and destroy the underlying connection.

Parameters:

con the IMAP connection to be terminated.

Returns:

This function returns no value.

Definition at line 79 of file `imap.c`.

References `con_destroy()`, `con_print()`, `con_status()`, `con_write_bl()`, `st_char_get()`, `st_length_int()`, and `status`.

5.151.2.60 `uint64_t imap_next_folder_order (inx_t * folders, uint64_t parent)`

Get the next order value for an imap folder.

Note:

The next order value is the current highest order value of any child folder in the specified directory, incremented by one.

Parameters:

folder an `inx` holder containing the collection of imap folders to be scanned.

parent the numerical id of the folder to be queried.

Returns:

0 on failure, or the next order value of the specified folder on success.

Definition at line 67 of file `folders.c`.

Referenced by `imap_parse_address()`.

5.151.2.65 `void imap_parse_address_put (stringer_t * buffer, chr_t c)`

LOW: Do we need an `imap_parse_address_group()` function?

Definition at line 12 of file `parse_address.c`.

References `st_avail_get()`, `st_char_get()`, `st_length_get()`, and `st_length_set()`.

Referenced by `imap_parse_address_part()`.

5.151.2.66 `int_t imap_parse_arguments (connection_t * con, chr_t ** start, size_t * length)`

Parse a chunk of input into an array of IMAP arguments.

See also:

[imap_parse_qstring\(\)](#), [imap_parse_literal\(\)](#), [imap_parse_array\(\)](#), [imap_parse_astring\(\)](#)

Note:

This function scans a string for an array of arguments, performing the following logic when a particular character is encountered: `:` Parse argument as quoted string with [imap_parse_qstring\(\)](#). `{` : Parse argument as literal string with [imap_parse_literal\(\)](#). `(` or `[` : Parse argument as array with [imap_parse_astring\(\)](#). `other` : Defaults to parsing argument as atomic string with `imap_parse_atomic()`. The supplied `start` and `length` pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

start the address of a pointer to the start of the buffer to be parsed, that will be continually updated to point to the next argument in the sequence during the parsing loop.

length a pointer to a `size_t` variable that contains the length of the string to be parsed, that will be continually updated with the input stream position during the parsing loop.

Returns:

-1 on parsing error or 1 on success.

Definition at line 709 of file `parse.c`.

References `ar_append()`, `ar_free()`, `IMAP_ARGUMENT_TYPE_ARRAY`, `IMAP_ARGUMENT_TYPE_ASTRING`, `IMAP_ARGUMENT_TYPE_LITERAL`, `IMAP_ARGUMENT_TYPE_QSTRING`, `imap_parse_array()`, `imap_parse_astring()`, `imap_parse_literal()`, and `imap_parse_qstring()`.

Referenced by `imap_command_parser()`.

5.151.2.67 `int_t imap_parse_array (int_t recursion, connection_t * con, imap_arguments_t ** array, chr_t ** start, size_t * length)`

Extract the contents of an array argument and advance the position of the parser stream.

Note:

This function expects as input a string beginning either with '(' or '['.

Parameters:

length a pointer to a `size_t` variable that contains the length of the string to be parsed, and that will be updated to reflect the length of the remainder of the input string that follows the parsed literal string.

recursion `d`

con the client IMAP connection passing the array as input to the server.

array -

start -

length -

Returns:

Definition at line 595 of file `parse.c`.

References `ar_append()`, `ar_free()`, `IMAP_ARGUMENT_TYPE_ARRAY`, `IMAP_ARGUMENT_TYPE_LITERAL`, `IMAP_ARGUMENT_TYPE_NSTRING`, `IMAP_ARGUMENT_TYPE_QSTRING`, `IMAP_ARRAY_RECURSION_LIMIT`, `imap_parse_array()`, `imap_parse_literal()`, `imap_parse_nstring()`, `imap_parse_qstring()`, `log_pedantic`, and `type()`.

Referenced by `imap_parse_arguments()`, and `imap_parse_array()`.

5.151.2.68 int_t imap_parse_astring (stringer_t ** output, chr_t ** start, size_t * length)

Extract the contents of an atomic string and advance the position of the parser stream.

Note:

This function scans a string, expecting printable ASCII characters until it encounters a space, , , (, or [. If any other character is encountered before that point, an error will be returned. The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

output the address of a managed string that will receive a copy of the atomic string's contents on success, or NULL on failure.

start the address of a pointer to the start of the buffer to be parsed, that will also be updated to point to the next argument in the sequence on success.

length a pointer to a `size_t` variable that contains the length of the string to be parsed, and which will be updated to reflect the length of the remainder of the input string that follows the parsed atomic string.

Returns:

-1 on general error or if an invalid character was encountered, or 1 if the supplied atomic string was valid.

Definition at line 154 of file `parse.c`.

References `log_pedantic`, and `st_import()`.

Referenced by `imap_command_parser()`, and `imap_parse_arguments()`.

5.151.2.69 imap_fetch_dataitems_t* imap_parse_dataitems (imap_arguments_t * arguments)

Referenced by `imap_fetch()`.

5.151.2.70 `int_t imap_parse_literal (connection_t * con, stringer_t ** output, chr_t ** start, size_t * length)`

Extract the contents of a literal string and advance the position of the parser stream.

Note:

This function expects as input a string beginning with '{' and followed by a numerical string, an optional '+', and a closing '}'. After reading in the numerical size parameter, it then attempts to read in that many bytes of input from the network stream.

Parameters:

con the client IMAP connection passing the literal string as input to the server.

output the address of a managed string that will receive a copy of the literal string's contents on success, or NULL on failure or if it is zero length.

start the address of a pointer to the start of the buffer to be parsed (beginning with '{'), that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and that will be updated to reflect the length of the remainder of the input string that follows the parsed literal string.

Returns:

-1 on general or parse error or if an enclosing pair of double quotes was not found, or 1 if the supplied quoted string was valid.

Definition at line 381 of file `parse.c`.

References `con_read()`, `con_read_line()`, `con_write_bl()`, `line_pl_st()`, `log_pedantic`, `mm_copy()`, `mm_move()`, `number`, `pl_empty()`, `pl_length_get()`, `pl_null()`, `st_alloc()`, `st_char_get()`, `st_free()`, `st_length_set()`, and `uint64_conv_bl()`.

Referenced by `imap_parse_array()`.

5.151.2.72 `int_t imap_parse_qstring (stringer_t ** output, chr_t ** start, size_t * length)`

Extract the contents of a quoted string and advance the position of the parser stream.

Note:

This function scans a string beginning with '"' for a terminating '"', returning an error if or is encountered first. It is also able to handle escaped characters. The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

- output** the address of a managed string that will receive a copy of the quoted string's contents on success, or NULL on failure or if it is zero length.
- start** the address of a pointer to the start of the buffer to be parsed (beginning with \), that will also be updated to point to the next argument in the sequence on success.
- length** a pointer to a size_t variable that contains the length of the string to be parsed, and which will be updated to reflect the length of the remainder of the input string that follows the parsed quoted string.

Returns:

- 1 on general error or if an enclosing pair of double quotes was not found, or 1 if the supplied quoted string was valid.

Definition at line 251 of file parse.c.

References log_pedantic, st_alloc(), st_char_get(), and st_length_set().

Referenced by imap_parse_arguments(), and imap_parse_array().

5.151.2.73 void imap_process (connection_t * con)

Perform client command processing on an established imap session.

Note:

- This function will read the next line of user input, parse the command, and then attempt to execute it with the appropriate handler.

Parameters:

- con** a pointer to the connection object underlying the imap session.

Returns:

- This function returns no value.

Definition at line 61 of file commands.c.

5.151.2.94 void imap_store (connection_t * con)

LOW: Shouldn't we be checking for stale status info so the update doesn't make decisions based on incorrect status data? On the other hand the actual IMAP logic is passed all the way through to the DB so even if the server ends up with incorrect status information, the database should remain accurate.

Referenced by `imap_store()`.

5.151.2.98 bool_t imap_valid_folder_name (stringer_t * *name*)

Check to see if a name is a valid imap folder name.

Note:

The following naming checks are enforced: 1. The name can't be empty or begin with a period. 2. It cannot contain a non-printable character. 3. Trailing periods will be removed. 4. The folder name cannot contain consecutive periods.

Parameters:

name a managed string containing the imap folder name to be validated.

Returns:

true on success or false on failure.

Definition at line 157 of file folders.c.

References log_pedantic, st_empty_out(), st_length_get(), and st_length_set().

Referenced by contact_folder_create(), contact_folder_rename(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), and imap_folder_status().

- void [net_listen](#) (void)
- [bool_t](#) [net_init](#) ([server_t](#) *server)
[listeners.c](#)
- void [net_trigger](#) ([bool_t](#) verbose)
Triggers a connection for each server instance, allowing the the listeners to shutdown cleanly. And then purges any remaining sockets.
- void [net_shutdown](#) ([server_t](#) *server)
Close the listening socket associated with a server.

5.152.1 Function Documentation

5.152.1.1 void net_accept (server_t * server)

Definition at line 10 of file listeners.c.

References [server_t::network](#), [protocol_process\(\)](#), [server_t::sockd](#), [status](#), [thread_start\(\)](#), and [thread_stop\(\)](#).

Referenced by [net_listen\(\)](#).

5.152.1.2 bool_t net_init (server_t * server)

[listeners.c](#)

Definition at line 58 of file listeners.c.

References [server_t::ipv6](#), [server_t::listen_queue](#), [log_critical](#), [magma](#), [mm_wipe\(\)](#), [net_set_buffer_length\(\)](#), [net_set_reuseable_address\(\)](#), [server_t::network](#), [magma_t::network_buffer](#), [server_t::port](#), [server_t::sockd](#), and [magma_t::system](#).

Referenced by [servers_network_start\(\)](#).

5.152.1.3 void net_listen (void)

Definition at line 33 of file listeners.c.

References [server_t::enabled](#), [magma](#), [MAGMA_SERVER_INSTANCES](#), [mm_free\(\)](#), [mm_wipe\(\)](#), [net_accept\(\)](#), [server_t::network](#), [magma_t::servers](#), [server_t::sockd](#), [thread_alloc\(\)](#), and [thread_join\(\)](#).

Referenced by [main\(\)](#).

5.152.1.4 void net_shutdown (server_t * server)

Close the listening socket associated with a server.

Returns:

This function returns no value.

Definition at line 216 of file listeners.c.

References `server_t::network`, and `server_t::sockd`.

Referenced by `servers_network_stop()`.

5.152.1.5 `void net_trigger (bool_t verbose)`

Triggers a connection for each server instance, allowing the the listeners to shutdown cleanly. And then purges any remaining sockets.

LOW: This only compares the port number for the sockets. We should also ensure the socket is owned by `magmad`, and/or that the server used `INADDR_ANY` or `IN6ADDR_ANY_INIT`, otherwise the logic below will close sockets that could be owned by other processes on the system that are using the same port number, while bound to a different IP interface.

Definition at line 129 of file listeners.c.

Data Structures

- struct [key_pair_t](#)
- struct [meta_stats_tag_t](#)

Functions

- [meta_alert_t * alert_alloc](#) (uint64_t alertnum, [stringer_t](#) *type, [stringer_t](#) *message, uint64_t created)
alerts.c
- [meta_stats_tag_t * meta_folder_stats_tag_alloc](#) ([stringer_t](#) *tag)
folders.c
- [meta_folder_t * meta_folders_by_name](#) ([inx_t](#) *folders, [stringer_t](#) *name)
Get a folder by its fully qualified name.
- [meta_folder_t * meta_folders_by_number](#) ([inx_t](#) *folders, uint64_t number)
Get a folder by number.
- [int_t meta_folders_children](#) ([inx_t](#) *folders, uint64_t number)
Get the number of direct child folders of a specified parent folder.
- [stringer_t * meta_folders_name](#) ([inx_t](#) *list, [meta_folder_t](#) *folder)
Get a folder's fully qualified name.
- [inx_t * meta_folders_stats_tags](#) ([inx_t](#) *messages, uint64_t folder)
Create a collection of meta tag stats for a set of messages.
- [bool_t meta_user_serial_check](#) ([meta_user_t](#) *user, uint64_t object)
serials.c
- [uint64_t meta_user_serial_get](#) ([meta_user_t](#) *user, uint64_t object)
Get an object serial number for a given meta object.
- [void meta_user_serial_set](#) ([meta_user_t](#) *user, uint64_t object, uint64_t serial)
Set an object serial number for a given meta user structure.
- [int_t meta_update_aliases](#) ([meta_user_t](#) *user, [META_LOCK_STATUS](#) locked)
updaters.c
- [int_t meta_update_contacts](#) ([meta_user_t](#) *user, [META_LOCK_STATUS](#) locked)
Update a user's contacts if necessary.
- [int_t meta_update_folders](#) ([meta_user_t](#) *user, [META_LOCK_STATUS](#) locked)
Update a user's message folders if necessary.
- [int_t meta_update_keys](#) ([meta_user_t](#) *user, [META_LOCK_STATUS](#) locked)
Fetches the user signet and private key. Relies on the mail realm to decrypt the values.
- [int_t meta_update_message_folders](#) ([meta_user_t](#) *user, [META_LOCK_STATUS](#) locked)

Refresh a user's message folders if stale, or retrieve them from the database if they are not in memory.

- [int_t meta_update_realms](#) ([meta_user_t](#) *user, [stringer_t](#) *salt, [stringer_t](#) *master, [META_LOCK_STATUS](#) locked)
Fetches the user realm keys and extracts the different components.
- [int_t meta_update_user](#) ([meta_user_t](#) *user, [META_LOCK_STATUS](#) locked)
Build a user's meta information from specified data parameters.
- void [meta_user_ref_add](#) ([meta_user_t](#) *user, [META_PROTOCOL](#) protocol)
references.c
- void [meta_user_ref_dec](#) ([meta_user_t](#) *user, [META_PROTOCOL](#) protocol)
Decrement a user's reference counter for the specified protocol and update the activity timestamp.
- [uint64_t meta_user_ref_protocol_total](#) ([meta_user_t](#) *user, [META_PROTOCOL](#) protocol)
Get the total reference count for the user object over the specified protocol.
- [time_t meta_user_ref_stamp](#) ([meta_user_t](#) *user)
Get the activity timestamp for a meta user object.
- [uint64_t meta_user_ref_total](#) ([meta_user_t](#) *user)
Get the total reference count for a user object, over all of the supported protocols.
- [meta_user_t](#) * [meta_alloc](#) (void)
meta.c
- void [meta_free](#) ([meta_user_t](#) *user)
Free a meta user object.
- [int_t meta_get](#) ([uint64_t](#) usernum, [stringer_t](#) *username, [stringer_t](#) *salt, [stringer_t](#) *master, [stringer_t](#) *verification, [META_PROTOCOL](#) protocol, [META_GET](#) get, [meta_user_t](#) **output)
Lookup user and return their meta user object.
- [bool_t meta_data_acknowledge_alert](#) ([uint64_t](#) alertnum, [uint64_t](#) usernum, [uint32_t](#) transaction)
datatier.c
- [uint64_t meta_data_delete_folder](#) ([uint64_t](#) usernum, [uint64_t](#) foldernum)
Delete a message folder from the database.
- [int_t meta_data_delete_tag](#) ([meta_message_t](#) *message, [stringer_t](#) *tag)
Remove a tag from a message in the database.
- [inx_t](#) * [meta_data_fetch_alerts](#) ([uint64_t](#) usernum)
Get all unacknowledged alert messages for a user.
- [inx_t](#) * [meta_data_fetch_all_tags](#) ([uint64_t](#) usernum)
Fetch all the tags attached to messages of a specified user from the database.
- [bool_t meta_data_fetch_folders](#) ([meta_user_t](#) *user)
Retrieve all of a user's message folders from the database.
- [int_t meta_data_fetch_keys](#) ([meta_user_t](#) *user, [key_pair_t](#) *output, [int64_t](#) transaction)
Retrieve the encryption keys for a user account.

- [int_t meta_data_fetch_mailbox_aliases](#) ([meta_user_t](#) *user)
Get all the mailbox aliases for a specified user.
- [int_t meta_data_fetch_shard](#) (uint64_t usernum, uint16_t serial, [stringer_t](#) *label, [stringer_t](#) *output, [uint_t](#) *rotated, int64_t transaction)
Retrieve a shard value for user account.
- [int_t meta_data_fetch_user](#) ([meta_user_t](#) *user)
Build a meta user object by username, hashed password, and hashed key storage password.
- [bool_t meta_data_flags_add](#) ([inx_t](#) *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)
Add the specified flags mask to a collection of mail messages.
- [bool_t meta_data_flags_remove](#) ([inx_t](#) *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)
Remove the specified flags mask from a collection of mail messages.
- [bool_t meta_data_flags_replace](#) ([inx_t](#) *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)
Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.
- [uint64_t meta_data_insert_folder](#) (uint64_t usernum, [stringer_t](#) *name, uint64_t parent, uint32_t order)
Insert a new mail folder into the database.
- [int_t meta_data_insert_keys](#) (uint64_t usernum, [stringer_t](#) *username, [key_pair_t](#) *input, int64_t transaction)
Store the encryption keys for a user account.
- [int_t meta_data_insert_shard](#) (uint64_t usernum, uint16_t serial, [stringer_t](#) *label, [stringer_t](#) *shard, int64_t transaction)
Store the user realm shard value.
- [int_t meta_data_insert_tag](#) ([meta_message_t](#) *message, [stringer_t](#) *tag)
Insert a tag for a message into the database.
- [int_t meta_data_truncate_tags](#) ([meta_message_t](#) *message)
Remove all tags associated with a message in the database.
- [uint64_t meta_data_update_folder_name](#) (uint64_t usernum, uint64_t foldernum, [stringer_t](#) *name, uint64_t parent, uint32_t order)
Update the record for a message folder in the database.
- void [meta_data_update_lock](#) (uint64_t usernum, uint8_t lock)
- void [meta_data_update_log](#) ([meta_user_t](#) *user, [META_PROTOCOL](#) prot)
Update the per-user entry in the Log table for the specified protocol.
- void [meta_user_rlock](#) ([meta_user_t](#) *user)
locking.c
- void [meta_user_unlock](#) ([meta_user_t](#) *user)
Release the lock for a meta user object.
- void [meta_user_wlock](#) ([meta_user_t](#) *user)
Acquire a write lock for a meta user object.
- [meta_user_t](#) * [meta_inx_find](#) (uint64_t usernum, [META_PROTOCOL](#) protocol)
indexes.c

- void [meta_inx_remove](#) (uint64_t usernum, [META_PROTOCOL](#) protocol)
Lock a user's object in the cache and decrement their reference counter.
- [int_t meta_crypto_keys_create](#) (uint64_t usernum, [stringer_t](#) *username, [stringer_t](#) *realm, int64_t transaction)
crypto.c
- [meta_alias_t * alias_alloc](#) (uint64_t aliasnum, [stringer_t](#) *address, [stringer_t](#) *display, [int_t](#) selected, uint64_t created)
alias.c

5.154.1 Function Documentation

5.154.1.1 [meta_alert_t* alert_alloc](#) (uint64_t *alertnum*, [stringer_t](#) * *type*, [stringer_t](#) * *message*, uint64_t *created*)

[alerts.c](#) [alerts.c](#)

Parameters:

- alertnum*** the numerical id of the user alert.
- type*** a pointer to a managed string containing the type of the alert (e.g. "warning" or "alert").
- message*** a pointer to a managed string containing the alert message.
- created*** the UTC timecode for when the alert message was created.

Returns:

NULL on error or a pointer to the newly initialized user alert message object on success.

Definition at line 18 of file [alerts.c](#).

References [align\(\)](#), [FOREIGNDATA](#), [JOINTED](#), [log_pedantic](#), [meta_alert_t](#), [mm_alloc\(\)](#), [mm_copy\(\)](#), [PLACER_T](#), [placer_t](#), [st_data_get\(\)](#), [st_length_get\(\)](#), and [STACK](#).

Referenced by [meta_data_fetch_alerts\(\)](#).

5.154.1.2 [meta_alias_t* alias_alloc](#) (uint64_t *aliasnum*, [stringer_t](#) * *address*, [stringer_t](#) * *display*, [int_t](#) *selected*, uint64_t *created*)

[alias.c](#) [alias.c](#)

Parameters:

- aliasnum*** the numerical identifier of the user alias.
- address*** a managed string containing the email address associated with the alias.
- display*** a managed string containing the display name associated with the alias.
- selected*** a flag specifying whether this alias is the default selection for the user.
- created*** a UNIX timestamp for the creation of this alias.

Returns:

NULL on failure, or a pointer to the newly initialized user alias object on success.

Definition at line 19 of file [alias.c](#).

References [align\(\)](#), [FOREIGNDATA](#), [JOINTED](#), [log_pedantic](#), [meta_alias_t](#), [mm_alloc\(\)](#), [mm_copy\(\)](#), [PLACER_T](#), [placer_t](#), [st_data_get\(\)](#), [st_length_get\(\)](#), and [STACK](#).

Referenced by [meta_data_fetch_mailbox_aliases\(\)](#).

5.154.1.3 meta_user_t* meta_alloc (void)

meta.c meta.c

Returns:

NULL on failure, or a pointer to the newly allocated meta user object on success.

Definition at line 47 of file meta.c.

References log_pedantic, meta_user_t, mm_alloc(), mm_free(), mm_wipe(), mutex_init(), rwlock_attr_destroy(), rwlock_attr_init(), rwlock_attr_setkind(), rwlock_destroy(), and rwlock_init().

Referenced by meta_inx_find().

5.154.1.4 int_t meta_crypto_keys_create (uint64_t usernum, stringer_t * username, stringer_t * realm, int64_t transaction)

crypto.c crypto.c

Parameters:

user

master

Returns:

-1 if an error occurs, 0 if successful, and 1 if the insertion fails because a key already exists.

Definition at line 18 of file crypto.c.

References BINARY, log_info, log_pedantic, meta_data_insert_keys(), NONE, org_key, prime_cleanup(), prime_free(), prime_get(), prime_key_encrypt(), prime_key_generate(), prime_request_generate(), prime_request_sign(), prime_t, PRIME_USER_KEY, key_pair_t::private, key_pair_t::public, st_char_get(), st_cleanup, st_free(), and st_length_int().

5.154.1.5 bool_t meta_data_acknowledge_alert (uint64_t alertnum, uint64_t usernum, uint32_t transaction)

datatier.c datatier.c

Note:

If the table is not updated immediately, another check is made to see if the alert is still pending. If so, false is returned.

Parameters:

alertnum the numerical id of the alert message to be acknowledged.

usernum the numerical id of the user to whom the alert message belongs.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

true if the alert was acknowledged successfully, or false on failure.

Definition at line 584 of file datatier.c.

References log_pedantic, mm_wipe(), res_field_uint64(), res_row_next(), res_table_free(), stmt_exec_affected_conn(), and stmt_get_result_conn().

Referenced by portal_endpoint_alert_acknowledge().

5.154.1.6 uint64_t meta_data_delete_folder (uint64_t *usernum*, uint64_t *foldernum*)

Delete a message folder from the database.

Parameters:

usernum the numerical id of the user that owns the folder to be deleted.

foldernum the folder id of the message folder to be deleted.

Returns:

1 if the message folder was successfully, or <= 0 if there was an error.

Definition at line 932 of file `datatier.c`.

References `M_FOLDER_MESSAGES`, `mm_wipe()`, `stmt_exec_affected()`, and `type()`.

Referenced by `imap_folder_remove()`.

5.154.1.7 int_t meta_data_delete_tag (meta_message_t * *message*, stringer_t * *tag*)

Remove a tag from a message in the database.

Parameters:

message a pointer to the meta message object of the message to have the tag stripped.

tag a managed string containing the name of the tag to be deleted.

Returns:

0 on success or -1 on failure.

Definition at line 1137 of file `datatier.c`.

References `mm_wipe()`, `st_char_get()`, `st_length_get()`, and `stmt_exec_affected()`.

Referenced by `portal_endpoint_messages_tag()`.

5.154.1.8 inx_t* meta_data_fetch_alerts (uint64_t *usernum*)

Get all unacknowledged alert messages for a user.

Parameters:

usernum the numerical id of the user for whom the alert messages will be fetched.

Returns:

NULL on failure, or a pointer to an `inx` holder containing all of the user's alert messages on success.

Definition at line 649 of file `datatier.c`.

References `alert_alloc()`, `inx_alloc()`, `inx_free()`, `inx_insert()`, `inx_t`, `log_error`, `log_info`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `meta_alert_t`, `mm_free()`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_length()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `stmt_get_result()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `portal_endpoint_alert_list()`.

5.154.1.9 `inx_t* meta_data_fetch_all_tags (uint64_t usernum)`

Fetch all the tags attached to messages of a specified user from the database.

Parameters:

usernum the numerical id of the user for whom the message tags will be fetched.

Returns:

NULL on failure, or an `inx` holder containing a list of all the user's messages' tags as managed strings on success.

Definition at line 1170 of file `datatier.c`.

References `inx_alloc()`, `inx_free()`, `inx_insert()`, `inx_t`, `log_error`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `res_field_string()`, `res_row_next()`, `res_table_free()`, `st_free()`, `stmt_get_result()`, `multi_t::type`, `multi_t::u64`, and `multi_t::val`.

Referenced by `portal_endpoint_messages_tags()`.

5.154.1.10 `bool_t meta_data_fetch_folders (meta_user_t * user)`

Retrieve all of a user's message folders from the database.

Note:

If the user already had a working set of message folders they will be deleted first.

Parameters:

user a pointer to the meta user object of the user making the request, which will be updated on success.

Returns:

-1 on failure or 1 on success.

Definition at line 58 of file `datatier.c`.

References `inx_alloc()`, `inx_cleanup()`, `inx_insert()`, `log_error`, `log_pedantic`, `M_FOLDER_MESSAGES`, `M_INX_LINKED`, `M_TYPE_UINT64`, `meta_folder_t`, `mm_alloc()`, `mm_copy()`, `mm_free()`, `mm_wipe()`, `res_field_block()`, `res_field_length()`, `res_field_uint32()`, `res_field_uint64()`, `res_row_next()`, `res_table_free()`, `stmt_get_result()`, `multi_t::type`, `type()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `meta_update_folders()`.

5.154.1.11 `int_t meta_data_fetch_keys (meta_user_t * user, key_pair_t * output, int64_t transaction)`

Retrieve the encryption keys for a user account.

Parameters:

user a meta object with the user number field populated.

output a key pair object to hold the results.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 307 of file `datatier.c`.

References `base64_decode_mod()`, `log_pedantic`, `mm_wipe()`, `PLACER`, `key_pair_t::private`, `key_pair_t::public`, `res_field_block()`, `res_field_length()`, `res_row_next()`, `res_table_free()`, `st_char_get()`, `st_empty`, `st_free()`, `st_length_int()`, and `stmt_get_result_conn()`.

Referenced by `meta_update_keys()`.

5.154.1.12 int_t meta_data_fetch_mailbox_aliases (meta_user_t * user)

Get all the mailbox aliases for a specified user.

Parameters:

user a pointer to the partially populated meta user object to be queried, with its usernum field set.

Returns:

true on success or false on failure.

Definition at line 159 of file datatier.c.

References alias_alloc(), inx_alloc(), inx_cleanup(), inx_insert(), log_error, log_info, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, meta_alias_t, mm_free(), mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_field_uint8(), res_row_next(), res_table_free(), st_char_get(), st_length_int(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by meta_update_aliases().

5.154.1.13 int_t meta_data_fetch_shard (uint64_t usernum, uint16_t serial, stringer_t * label, stringer_t * output, uint_t * rotated, int64_t transaction)

Retrieve a shard value for user account.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

serial the serial number associated with the shard value.

label the textual label associated with the shard value.

output the buffer where the binary output should be stored.

rotated the buffer where the rotated variable is stored.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 440 of file datatier.c.

References base64_decode_mod(), log_pedantic, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint8(), res_row_next(), res_table_free(), st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), st_opt_get(), st_valid_destination(), STACIE_SHARD_LENGTH, and stmt_get_result_conn().

Referenced by meta_update_realms().

5.154.1.14 int_t meta_data_fetch_user (meta_user_t * user)

Build a meta user object by username, hashed password, and hashed key storage password.

Parameters:

user a meta object with the user number field populated.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 224 of file `datatier.c`.

References `base64_decode_mod()`, `log_pedantic`, `META_USER_ENCRYPT_DATA`, `META_USER_OVERQUOTA`, `META_USER_TLS`, `mm_wipe()`, `PLACER`, `res_field_block()`, `res_field_int8()`, `res_field_length()`, `res_field_string()`, `res_row_next()`, `res_table_free()`, `st_cleanup`, `st_empty`, and `stmt_get_result()`.

Referenced by `meta_update_user()`.

5.154.1.15 `bool_t meta_data_flags_add (inx_t * messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)`

Add the specified flags mask to a collection of mail messages.

Parameters:

messages an `inx` holder containing the collection of messages to have their flags updated.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 869 of file `datatier.c`.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `meta_message_t`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `imap_fetch()`, `imap_update_flags()`, `portal_endpoint_messages_flag()`, and `portal_endpoint_messages_tag()`.

5.154.1.16 `bool_t meta_data_flags_remove (inx_t * messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)`

Remove the specified flags mask from a collection of mail messages.

Parameters:

messages an `inx` holder containing the collection of messages to have their flags removed.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be stripped from any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 795 of file `datatier.c`.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `meta_message_t`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `imap_select()`, `imap_update_flags()`, `portal_endpoint_messages_flag()`, and `portal_endpoint_messages_tag()`.

5.154.1.17 `bool_t meta_data_flags_replace (inx_t * messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)`

Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.

Note:

The new mask can contain both user and system flags, but only user flags will be stripped from each message initially.

Parameters:

messages an inx holder containing the collection of messages to have their flags updated.
usenum the numerical of the user to whom the target messages belong, for validation purposes.
foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.
flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 713 of file datatier.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `log_pedantic`, `MAIL_STATUS_USER_FLAGS`, `meta_message_t`, `mm_wipe()`, and `stmt_exec()`.

Referenced by `imap_update_flags()`, and `portal_endpoint_messages_flag()`.

5.154.1.18 uint64_t meta_data_insert_folder (uint64_t usenum, stringer_t * name, uint64_t parent, uint32_t order)

Insert a new mail folder into the database.

Parameters:

usenum the numerical id of the user to whom the new folder belongs.
name a managed string containing the name of the new mail folder.
parent the numerical id of the mail folder to be the parent of the new mail folder.
order the order number of this folder in its parent folder.

Returns:

0 on failure, or the numerical id of the newly inserted mail folder in the database on success.

Definition at line 1028 of file datatier.c.

References `M_FOLDER_MESSAGES`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `stmt_insert()`, and `type()`.

Referenced by `imap_folder_create()`, and `imap_folder_rename()`.

5.154.1.19 int_t meta_data_insert_keys (uint64_t usenum, stringer_t * username, key_pair_t * input, int64_t transaction)

Store the encryption keys for a user account.

Parameters:

usenum the numerical id of the user to whom the alert message belongs.
username the plain text username.
input the public and private key pair.
transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 372 of file datatier.c.

References `base64_encode_mod()`, `log_pedantic`, `mm_wipe()`, `key_pair_t::private`, `key_pair_t::public`, `st_char_get()`, `st_cleanup`, `st_length_get()`, `st_length_int()`, `st_populated`, and `stmt_exec_affected_conn()`.

Referenced by `meta_crypto_keys_create()`.

5.154.1.20 `int_t meta_data_insert_shard (uint64_t usernum, uint16_t serial, stringer_t * label, stringer_t * shard, int64_t transaction)`

Store the user realm shard value.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

serial the nummerid serial number associated with the shard value.

label the textual label associated with the shard value.

shard the binary shard value.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 508 of file `datatier.c`.

References `base64_encode_mod()`, `log_pedantic`, `MANAGEDBUF`, `mm_wipe()`, `st_char_get()`, `st_data_get()`, `st_empty`, `st_length_get()`, `st_length_int()`, `STACIE_SHARD_LENGTH`, and `stmt_exec_affected_conn()`.

Referenced by `meta_update_realms()`.

5.154.1.21 `int_t meta_data_insert_tag (meta_message_t * message, stringer_t * tag)`

Insert a tag for a message into the database.

Parameters:

message the meta message object of the message to be tagged.

tag a managed string containing the name of the tag.

Returns:

0 on success or -1 on failure.

Definition at line 1075 of file `datatier.c`.

References `mm_wipe()`, `st_char_get()`, `st_length_get()`, and `stmt_exec_affected()`.

Referenced by `portal_endpoint_messages_tag()`.

5.154.1.22 `int_t meta_data_truncate_tags (meta_message_t * message)`

Remove all tags associated with a message in the database.

Parameters:

message a pointer to the meta message object of the message to have all of its tags stripped.

Returns:

0 on success or -1 on failure.

Definition at line 1108 of file `datatier.c`.

References `mm_wipe()`, and `stmt_exec_affected()`.

Referenced by `portal_endpoint_messages_tag()`.

5.154.1.23 `uint64_t meta_data_update_folder_name (uint64_t usernum, uint64_t foldernum, stringer_t * name, uint64_t parent, uint32_t order)`

Update the record for a message folder in the database.

Parameters:

- usernum* the numerical id of the user that owns the specified folder.
- foldernum* the id of the folder to have its properties adjusted.
- name* a managed string containing the new name of the specified folder.
- parent* the id of the new parent folder to be set for the specified message folder.
- order* the value of the order for the specified folder.

Returns:

1 on success, or <= 0 on failure.

Definition at line 972 of file `datatier.c`.

References `M_FOLDER_MESSAGES`, `mm_wipe()`, `st_char_get()`, `st_length_get()`, `stmt_exec_affected()`, and `type()`.

Referenced by `imap_folder_rename()`.

5.154.1.24 `void meta_data_update_lock (uint64_t usernum, uint8_t lock)`

5.154.1.25 `void meta_data_update_log (meta_user_t * user, META_PROTOCOL prot)`

Update the per-user entry in the Log table for the specified protocol.

Note:

This function will set the last session timestamp for the user, and increment the sessions counter in the database.

Parameters:

- user* the meta user object of the user making the logging request.
- prot* the protocol associated with the log request: `META_PROT_POP`, `META_PROT_IMAP`, or `META_PROT_WEB`.

Returns:

This function returns no value.

Definition at line 20 of file `datatier.c`.

References `log_pedantic`, `META_PROTOCOL_IMAP`, `META_PROTOCOL_POP`, `META_PROTOCOL_WEB`, `mm_wipe()`, and `stmt_exec_affected()`.

Referenced by `imap_login()`, and `pop_pass()`.

5.154.1.26 `meta_stats_tag_t* meta_folder_stats_tag_alloc (stringer_t * tag)`

`folders.c` `folders.c`

Parameters:

- tag* a managed string containing the name of the message tag.

Returns:

NULL on failure, or a newly allocated and initialized meta tag stat object on success.

Definition at line 15 of file folders.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), STACK, and meta_stats_tag_t::tag.

Referenced by meta_folders_stats_tags().

5.154.1.27 meta_folder_t* meta_folders_by_name (inx_t * *folders*, stringer_t * *name*)

Get a folder by its fully qualified name.

Parameters:

folders a pointer to an inx holder containing a list of folders to be traversed in the search.

folder a pointer to the meta folder object that is the leaf node of the folder path.

Returns:

NULL on failure or a managed string containing the fully qualified folder name on success.

Definition at line 138 of file folders.c.

References CONSTANT, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), meta_folder_t, meta_folders_name(), st_cmp_ci_eq(), st_cmp_cs_eq(), and st_free().

Referenced by imap_append(), imap_copy(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_folder_status(), imap_subscribe(), and portal_folder_mail_add().

5.154.1.28 meta_folder_t* meta_folders_by_number (inx_t * *folders*, uint64_t *number*)

Get a folder by number.

Parameters:

folders a pointer to an inx holder containing the folders to be searched.

number the numerical id of the folder to be retrieved.

Returns:

NULL on failure, or a pointer to the found meta folder object of the specified folder on success.

Definition at line 179 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), and meta_folder_t.

Referenced by meta_folders_name(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.154.1.29 int_t meta_folders_children (inx_t * *folders*, uint64_t *number*)

Get the number of direct child folders of a specified parent folder.

Parameters:

folders a pointer to an inx holder containing the the collection of folders to be traversed.

number the folder id of the parent folder to be scanned for children.

Returns:

the number of children folders in the specified parent folder, or 0 on failure.

Definition at line 207 of file folders.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, and `meta_folder_t`.

Referenced by `imap_folder_remove()`.

5.154.1.30 `stringer_t* meta_folders_name (inx_t * list, meta_folder_t * folder)`

Get a folder's fully qualified name.

Note:

This function will prepend the entire ancestor path of a folder to its name, with each level delimited by periods.

Parameters:

list a pointer to an `inx` holder containing a list of folders to be searched for parent folders.

folder a pointer to the meta folder object that is the leaf node of the folder path.

Returns:

NULL on failure or a managed string containing the fully qualified folder name on success.

Definition at line 99 of file folders.c.

References `FOLDER_RECURSION_LIMIT`, `log_pedantic`, `meta_folders_by_number()`, `ns_length_get()`, `st_free()`, `st_import()`, and `st_merge`.

Referenced by `imap_folder_name_escaped()`, `imap_narrow_folders()`, `meta_folders_by_name()`, `portal_endpoint_folders_rename()`, `portal_folder_mail_add()`, and `portal_folder_mail_remove()`.

5.154.1.31 `inx_t* meta_folders_stats_tags (inx_t * messages, uint64_t folder)`

Create a collection of meta tag stats for a set of messages.

Note:

Each meta tag stat will contain the name of a message tag, along with the number of messages with which it was associated.

Parameters:

messages an `inx` holder containing the list of messages to be examined.

folder the numerical id of the parent folder that contains all target messages.

Returns:

NULL on failure, or an `inx` holder containing all of the messages' meta tag stats on success.

LOW: This is a very inefficient method for counting the number of times each tag appears.

Definition at line 40 of file folders.c.

References `ar_field_st()`, `ar_length_get()`, `meta_stats_tag_t::count`, `inx_alloc()`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `inx_find()`, `inx_insert()`, `inx_t`, `log_pedantic`, `M_INX_HASHED`, `M_TYPE_STRINGER`, `meta_folder_stats_tag_alloc()`, `meta_message_t`, `mm_free()`, `multi_t::st`, and `multi_t::val`.

Referenced by `portal_endpoint_folders_tags()`.

5.154.1.32 void meta_free (meta_user_t * user)

Free a meta user object.

Parameters:

user a pointer to the meta user object to be destroyed.

Returns:

This function returns no value.

Definition at line 17 of file meta.c.

References `inx_cleanup()`, `mm_free()`, `mutex_destroy()`, `prime_cleanup()`, `rwlock_destroy()`, and `st_cleanup`.

Referenced by `meta_inx_find()`, and `obj_cache_start()`.

5.154.1.33 int_t meta_get (uint64_t usernum, stringer_t * username, stringer_t * salt, stringer_t * master, stringer_t * verification, META_PROTOCOL protocol, META_GET get, meta_user_t ** output)

Lookup user and return their meta user object.

Note:

If the user is not found in the local session cache, the session will be constructed using the database, and then cached.

Parameters:

usernum the numeric identifier for the user account.

username the official username stored in the database.

salt the user specific salt value.

master the user account's master encryption key which will be used to unlock the private storage key.

verification the verification token.

protocol a set of protocol specifying the protocol used by the calling function. Values can be `META_PROT_NONE`, `META_PROT_SMTP`, `META_PROT_POP`, `META_PROT_IMAP`, `META_PROT_WEB`, or `META_PROT_GENERIC`.

get a set of protocol specifying the data to be retrieved (`META_GET_NONE`, `META_GET_MESSAGES`, `META_GET_FOLDERS`, or `META_GET_CONTACTS`)

output the address of a meta user object that will store a pointer to the result of the lookup.

Returns:

-1 on error, 0 on success, 1 for an authentication issue.

Definition at line 112 of file meta.c.

References `log_pedantic`, `META_GET_ALIASES`, `META_GET_CONTACTS`, `META_GET_FOLDERS`, `META_GET_KEYS`, `META_GET_MESSAGES`, `meta_inx_find()`, `meta_inx_remove()`, `META_LOCKED`, `meta_messages_update()`, `meta_update_aliases()`, `meta_update_contacts()`, `meta_update_folders()`, `meta_update_keys()`, `meta_update_message_folders()`, `meta_update_realms()`, `meta_update_user()`, `meta_user_t`, `meta_user_unlock()`, `meta_user_wlock()`, `st_cleanup`, `st_cmp_cs_eq()`, `st_empty`, and `st_populated`.

Referenced by `api_endpoint_auth()`, `imap_login()`, `pop_pass()`, and `portal_endpoint_auth()`.

5.154.1.34 meta_user_t* meta_inx_find (uint64_t usernum, META_PROTOCOL protocol)

[indexes.c](#)

Definition at line 40 of file indexes.c.

References `inx_find()`, `inx_insert()`, `inx_lock_write()`, `inx_unlock()`, `M_TYPE_UINT64`, `object_cache_t::meta`, `meta_alloc()`, `meta_free()`, `meta_user_ref_add()`, `meta_user_t`, and `objects`.

Referenced by `meta_get()`.

5.154.1.35 `void meta_inx_remove(uint64_t usernum, META_PROTOCOL protocol)`

Lock a user's object in the cache and decrement their reference counter.

See also:

[meta_user_ref_dec\(\)](#)

Parameters:

username a managed string containing the name of the user to be adjusted.

protocol specifies the protocol bound to the reference counter to be decremented (`META_PROT_WEB`, `META_PROT_IMAP`, etc.)

Returns:

This function returns no value.

Definition at line 17 of file `indexes.c`.

References `inx_find()`, `inx_lock_read()`, `inx_unlock()`, `M_TYPE_UINT64`, `object_cache_t::meta`, `meta_user_ref_dec()`, `meta_user_t`, and `objects`.

5.154.1.36 `int_t meta_update_aliases(meta_user_t * user, META_LOCK_STATUS locked)`

[updaters.c](#) [updaters.c](#)

Parameters:

user a pointer to the meta object that is to be populated.

locked the meta lock status of the operation (if `META_NEED_LOCK` is supplied, the meta user object will be locked for the duration of the function).

Returns:

Definition at line 261 of file `updaters.c`.

References `meta_data_fetch_mailbox_aliases()`, `META_NEED_LOCK`, `meta_user_serial_get()`, `meta_user_serial_set()`, `meta_user_unlock()`, `meta_user_wlock()`, `OBJECT_ALIASES`, `serial_get()`, and `serial_increment()`.

Referenced by `meta_get()`, and `sess_update()`.

5.154.1.37 `int_t meta_update_contacts(meta_user_t * user, META_LOCK_STATUS locked)`

Update a user's contacts if necessary.

Note:

This function will try to retrieve the folders from the cache, if possible, or fall back to the database.

Parameters:

- user* a pointer to the meta user object that will have its message folders updated.
- locked* if META_NEED_LOCK is specified, the meta user object will be locked for operation.

Returns:

-1 on failure or 1 on success.

Definition at line 310 of file updaters.c.

References contacts_update(), inx_free(), inx_t, META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, serial_get(), and serial_increment().

Referenced by meta_get(), and sess_update().

5.154.1.38 int_t meta_update_folders (meta_user_t * user, META_LOCK_STATUS locked)

Update a user's message folders if necessary.

Note:

This function will try to retrieve the folders from the cache, if possible, or fall back to the database.

Parameters:

- user* a pointer to the meta user object that will have its message folders updated.
- locked* if META_NEED_LOCK is specified, the meta user object will be locked for operation.

Returns:

-1 on failure or 1 on success.

Definition at line 367 of file updaters.c.

References meta_data_fetch_folders(), meta_messages_update_sequences(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, serial_get(), and serial_increment().

Referenced by imap_session_update(), meta_get(), and sess_update().

5.154.1.39 int_t meta_update_keys (meta_user_t * user, META_LOCK_STATUS locked)

Fetches the user signet and private key. Relies on the mail realm to decrypt the values.

Parameters:

- user* a pointer to the meta object that is to be populated.
- locked* the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function).

Returns:

-2 if there is a problem unscrambling the private key, -1 for a system error, 0 for success, and 1 if the keys were created.

Definition at line 113 of file updaters.c.

References BINARY, log_pedantic, meta_crypto_keys_create(), meta_data_fetch_keys(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), NONE, prime_key_decrypt(), prime_set(), key_pair_t::private, key_pair_t::public, st_char_get(), st_cleanup, st_length_int(), st_populated, tran_commit(), tran_rollback(), and tran_start().

Referenced by meta_get().

5.154.1.40 int_t meta_update_message_folders (meta_user_t * user, META_LOCK_STATUS locked)

Refresh a user's message folders if stale, or retrieve them from the database if they are not in memory.

See also:

[messages_update\(\)](#)

Parameters:

user a pointer to the meta user object requesting the folders.

locked if META_LOCKED, lock the meta user object for the duration of the request.

Returns:

-1 on failure, or 1 on success.

Definition at line 419 of file updaters.c.

References [inx_free\(\)](#), [inx_t](#), [messages_update\(\)](#), [META_NEED_LOCK](#), [meta_user_unlock\(\)](#), [meta_user_wlock\(\)](#), [OBJECT_FOLDERS](#), [serial_get\(\)](#), and [serial_increment\(\)](#).

Referenced by [meta_get\(\)](#).

5.154.1.41 int_t meta_update_realms (meta_user_t * user, stringer_t * salt, stringer_t * master, META_LOCK_STATUS locked)

Fetches the user realm keys and extracts the different components.

Parameters:

user a pointer to the meta object that is to be populated.

master the user master key value.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function).

Returns:

-2 if there is a problem extracting the key values, -1 for a system error, 0 for success, and 1 if the keys were created.

Referenced by [meta_get\(\)](#).

5.154.1.42 int_t meta_update_user (meta_user_t * user, META_LOCK_STATUS locked)

Build a user's meta information from specified data parameters.

Note:

The user object will be pulled from the cache, if possible, or it falls back to a database lookup using the user number and the verification token.

Parameters:

user a pointer to the meta object that is to be populated.

usernum the user number.

verification the verification token for the specified user number.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function).

Returns:

-1 on error, 0 on success, 1 for an authentication issue.

Definition at line 211 of file updaters.c.

Referenced by `imap_session_update()`, `meta_get()`, and `sess_update()`.

5.154.1.43 void meta_user_ref_add (meta_user_t * user, META_PROTOCOL protocol)

[references.c](#) [references.c](#)

Note:

META_PROTOCOL_GENERIC can be specified for non-specific, protocol independent accounting purposes.

Parameters:

user a pointer to the meta user object to be adjusted.

protocol the protocol identifier for the session.

Returns:

This function returns no value.

Definition at line 20 of file references.c.

References `log_pedantic`, `META_PROTOCOL_GENERIC`, `META_PROTOCOL_IMAP`, `META_PROTOCOL_POP`, `META_PROTOCOL_SMTP`, `META_PROTOCOL_WEB`, `mutex_lock()`, and `mutex_unlock()`.

Referenced by `meta_inx_find()`.

5.154.1.44 void meta_user_ref_dec (meta_user_t * user, META_PROTOCOL protocol)

Decrement a user's reference counter for the specified protocol and update the activity timestamp.

Note:

META_PROTOCOL_GENERIC can be specified for non-specific, protocol independent accounting purposes.

Parameters:

user a pointer to the meta user object to be adjusted.

protocol the protocol identifier for the session using the META_PROTOCOL enumerator.

Returns:

This function returns no value.

Definition at line 60 of file references.c.

References log_pedantic, META_PROTOCOL_GENERIC, META_PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), and mutex_unlock().

Referenced by meta_inx_remove(), and portal_endpoint_logout().

5.154.1.45 uint64_t meta_user_ref_protocol_total (meta_user_t * user, META_PROTOCOL protocol)

Get the total reference count for the user object over the specified protocol.

Parameters:

user a pointer to the meta user object to be examined.

protocol the protocol identifier for the session using the META_PROTOCOL enumerator.

Returns:

the total number of references held by the user.

Definition at line 98 of file references.c.

References log_pedantic, META_PROTOCOL_GENERIC, META_PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), and mutex_unlock().

Referenced by pop_pass().

5.154.1.46 time_t meta_user_ref_stamp (meta_user_t * user)

Get the activity timestamp for a meta user object.

Parameters:

user a pointer to the meta user object to be examined.

Returns:

a timestamp containing the last time the meta user object's reference count changed.

Definition at line 161 of file references.c.

References mutex_lock(), and mutex_unlock().

Referenced by obj_cache_prune().

5.154.1.47 uint64_t meta_user_ref_total (meta_user_t * user)

Get the total reference count for a user object, over all of the supported protocols.

Parameters:

user a pointer to the meta user object to be examined.

Returns:

the total number of references held by the user.

Definition at line 134 of file references.c.

References mutex_lock(), and mutex_unlock().

Referenced by obj_cache_prune().

5.154.1.48 void meta_user_rlock (meta_user_t * user)[locking.c locking.c](#)**Parameters:**

user a pointer to the meta user object to be locked.

Returns:

This function returns no value.

Definition at line 15 of file locking.c.

References `rwlock_lock_read()`.

Referenced by `imap_close()`, `imap_examine()`, `imap_expunge()`, `imap_fetch()`, `imap_list()`, `imap_login()`, `imap_lsub()`, `imap_search_messages()`, `imap_status()`, `pop_last()`, `pop_list()`, `pop_retr()`, `pop_stat()`, `pop_top()`, `pop_uidl()`, `portal_endpoint_contacts_add()`, `portal_endpoint_contacts_copy()`, `portal_endpoint_contacts_edit()`, `portal_endpoint_folders_tags()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_list()`, and `portal_endpoint_messages_tag()`.

5.154.1.49 bool_t meta_user_serial_check (meta_user_t * user, uint64_t object)

[serials.c serials.c](#)

Note:

The object's serial number will be incremented regardless of whether it is consistent with the cache.

Parameters:

user the meta user object to whom the object belongs.

object the serial object to be checked for changes.

Returns:

0 if the object did not to be refreshed, or 1 if it doesn't match the internal checkpoint and should be updated.

Definition at line 86 of file serials.c.

References `meta_user_serial_get()`, `meta_user_serial_set()`, `serial_get()`, and `serial_increment()`.

Referenced by `portal_endpoint_messages_tag()`, and `sess_serial_check()`.

5.154.1.50 uint64_t meta_user_serial_get (meta_user_t * user, uint64_t object)

Get an object serial number for a given meta object.

Parameters:

user the meta user structure to be examined.

object the object to query for the serial number.

Returns:

the serial number value of the specified object, or 0 on failure. LOW: Swap the object and user params so the interface matches the `serial_get/set` functions.

Definition at line 53 of file serials.c.

References `OBJECT_ALIASES`, `OBJECT_CONTACTS`, `OBJECT_FOLDERS`, `OBJECT_MESSAGES`, and `OBJECT_USER`.

Referenced by `meta_update_aliases()`, `meta_update_user()`, and `meta_user_serial_check()`.

5.154.1.51 void meta_user_serial_set (meta_user_t * user, uint64_t object, uint64_t serial)

Set an object serial number for a given meta user structure.

Parameters:

user the meta user object to be adjusted.

object the object to receive the new serial number.

serial the new serial number to be set.

Returns:

This function returns no value.

Definition at line 20 of file serials.c.

References OBJECT_ALIASES, OBJECT_CONTACTS, OBJECT_FOLDERS, OBJECT_MESSAGES, and OBJECT_USER.

Referenced by meta_update_aliases(), meta_update_user(), and meta_user_serial_check().

5.154.1.52 void meta_user_unlock (meta_user_t * user)

Release the lock for a meta user object.

Parameters:

user a pointer to the meta user object to be unlocked.

Returns:

This function returns no value.

Definition at line 47 of file locking.c.

References rwlock_unlock().

Referenced by imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_list(), imap_login(), imap_lsub(), imap_rename(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_status(), imap_store(), imap_subscribe(), meta_get(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), pop_dele(), pop_last(), pop_list(), pop_pass(), pop_retr(), pop_session_destroy(), pop_session_reset(), pop_stat(), pop_top(), pop_uidl(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.154.1.53 void meta_user_wlock (meta_user_t * user)

Acquire a write lock for a meta user object.

Parameters:

user a pointer to the meta user object to be locked.

Returns:

This function returns no value.

Definition at line 31 of file locking.c.

References `rwlock_lock_write()`.

Referenced by `imap_append()`, `imap_close()`, `imap_copy()`, `imap_create()`, `imap_delete()`, `imap_examine()`, `imap_expunge()`, `imap_fetch()`, `imap_rename()`, `imap_select()`, `imap_session_destroy()`, `imap_session_update()`, `imap_store()`, `imap_subscribe()`, `meta_get()`, `meta_messages_copier()`, `meta_messages_login_update()`, `meta_messages_mover()`, `meta_messages_update()`, `meta_update_aliases()`, `meta_update_contacts()`, `meta_update_folders()`, `meta_update_keys()`, `meta_update_message_folders()`, `meta_update_realms()`, `meta_update_user()`, `pop_dele()`, `pop_pass()`, `pop_session_destroy()`, `pop_session_reset()`, `portal_endpoint_contacts_add()`, `portal_endpoint_contacts_copy()`, `portal_endpoint_contacts_edit()`, `portal_endpoint_contacts_move()`, `portal_endpoint_contacts_remove()`, `portal_endpoint_folders_rename()`, `portal_endpoint_messages_copy()`, `portal_endpoint_messages_flag()`, `portal_endpoint_messages_move()`, `portal_endpoint_messages_remove()`, `portal_endpoint_messages_tag()`, `portal_folder_contacts_add()`, `portal_folder_contacts_remove()`, `portal_folder_mail_add()`, and `portal_folder_mail_remove()`.

Enumerations

- enum { [REVERSE_ERROR](#) = -1, [REVERSE_EMPTY](#) = 0, [REVERSE_PENDING](#) = 1, [REVERSE_COMPLETE](#) = 2 }

Functions

- struct [__attribute__](#) ((packed))
- [ip_t * con_addr](#) ([connection_t](#) *con, [ip_t](#) *output)
addresses.c
- [octet_t con_addr_octet](#) ([connection_t](#) *con, [int_t](#) position)
Get a specified 8-bit octet of a connection's peer IP address.
- [stringer_t * con_addr_presentation](#) ([connection_t](#) *con, [stringer_t](#) *output)
Return a textual representation of the IP address of a specified connection handle.
- [stringer_t * con_addr_reversed](#) ([connection_t](#) *con, [stringer_t](#) *output)
Get the reversed-IP address string for a client connection.
- [segment_t con_addr_segment](#) ([connection_t](#) *con, [int_t](#) position)
Extract a specified 16 bit segment from a connection's peer IP address.
- [stringer_t * con_addr_standard](#) ([connection_t](#) *con, [stringer_t](#) *output)
Get the IP address string for the client connection.
- [stringer_t * con_addr_subnet](#) ([connection_t](#) *con, [stringer_t](#) *output)
Get the subnet string for a specified connection.
- [uint32_t con_addr_word](#) ([connection_t](#) *con, [int_t](#) position)
Get a specified 32-bit segment of a connection's peer IP address.
- [uint64_t con_decrement_refs](#) ([connection_t](#) *con)
connections.c
- void [con_destroy](#) ([connection_t](#) *con)
Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.
- void [con_flush](#) ([connection_t](#) *con)
Attempt to flush any buffered data associated with a network connection.

- `uint64_t con_increment_refs (connection_t *con)`
Increment a connection object's reference counter.
- `connection_t * con_init (int cond, server_t *server)`
Create a new connection object for a client connection.
- `bool_t con_init_network_buffer (connection_t *con)`
Allocate and initialize a new network buffer for a connection, if it is not already associated with one.
- `bool_t con_localhost (connection_t *con)`
Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.
- `bool_t con_private (connection_t *con)`
Determine whether a client connection is with a machine on the same private network.
- `int_t con_secure (connection_t *con)`
Return the security level of a specified connection.
- `int_t con_status (connection_t *con)`
Return the status of a specified connection.
- `void client_close (client_t *client)`
clients.c
- `client_t * client_connect (chr_t *host, uint32_t port)`
Establish a network client connection to a remote host.
- `int_t client_secure (client_t *client)`
Establish a TLS connection with a network client instance.
- `int_t client_status (client_t *client)`
Get the status of a network client.
- `bool_t net_set_buffer_length (int sd, int buffer_recv, int buffer_send)`
options.c
- `bool_t net_set_keepalive (int sd, bool_t keepalive, int_t idle, int_t interval, int_t tolerance)`
Set the keepalive flag, the.
- `bool_t net_set_linger (int sd, bool_t linger, int_t timeout)`
Set the linger flag for a socket.
- `bool_t net_set_nodelay (int sd, bool_t nodelay)`
Set the delay flag for a socket (to disable the Nagle algorithm).
- `bool_t net_set_blocking (int sd, bool_t blocking)`
Set the blocking flag for a socket.
- `bool_t net_set_reuseable_address (int sd, bool_t reuse)`
Set the reusable flag for a socket.
- `bool_t net_set_timeout (int sd, uint32_t timeout_recv, uint32_t timeout_send)`
Set the send and receive timeouts for a socket.

- `int64_t client_read (client_t *client)`
read.c
- `int64_t client_read_line (client_t *client)`
Read a line of input from a network client session.
- `int64_t con_read (connection_t *con)`
Read data from a network connection, and store the data in the connection context buffer.
- `int64_t con_read_line (connection_t *con, bool_t block)`
Read a line of input from a network connection.
- `stringer_t * con_reverse_check (connection_t *con, uint32_t timeout)`
reverse.c
- `void con_reverse_domain (connection_t *con, stringer_t *domain, int_t status)`
Set the domain name and reverse lookup status of a connection.
- `void con_reverse_enqueue (connection_t *con)`
Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.
- `void con_reverse_lookup (connection_t *con)`
Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.
- `void con_reverse_status (connection_t *con, int_t status)`
- `bool_t net_init (server_t *server)`
listeners.c
- `void net_listen (void)`
- `void net_shutdown (server_t *server)`
Close the listening socket associated with a server.
- `void net_trigger (bool_t verbose)`
Triggers a connection for each server instance, allowing the the listeners to shutdown cleanly. And then purges any remaining sockets.
- `int64_t client_print (client_t *client, chr_t *format,...)`
write.c
- `int64_t client_write (client_t *client, stringer_t *s)`
Write data to a network client.
- `int64_t con_print (connection_t *con, chr_t *format,...)`
Write a formatted string to a network connection.
- `int64_t con_write_bl (connection_t *con, char *block, size_t length)`
Write data to a network connection.
- `int64_t con_write_ns (connection_t *con, char *string)`
Write a null-terminated string to a network connection.
- `int64_t con_write_pl (connection_t *con, placer_t string)`
Write a placer to a network connection.

- `int64_t con_write_st (connection_t *con, stringer_t *string)`

Write a managed string to a network connection.

- `stringer_t * protocol_type (connection_t *con)`

Variables

- `command_t`
- `client_t`
- `connection_t`

5.155.1 Enumeration Type Documentation

5.155.1.1 anonymous enum

Enumerator:

REVERSE_ERROR

REVERSE_EMPTY

REVERSE_PENDING

REVERSE_COMPLETE

Definition at line 19 of file network.h.

5.155.2 Function Documentation

5.155.2.1 `struct __attribute__((packed)) [read]`

Definition at line 43 of file network.h.

References `command`, `command_t`, `imap_session_t`, `lock`, `placer_t`, and `status`.

5.155.2.2 `void client_close (client_t * client)`

[clients.c](#) [clients.c](#)

Note:

If `ssl` is in use, this will also destroy the overlying `ssl` session.

Returns:

This function returns no value.

Definition at line 175 of file `clients.c`.

References `mm_cleanup`, `mm_free()`, `st_cleanup`, and `tls_free()`.

Referenced by `net_trigger()`, `smtp_client_close()`, and `smtp_client_connect()`.

5.155.2.3 client_t* client_connect (chr_t * *host*, uint32_t *port*)

Establish a network client connection to a remote host.

Parameters:

host a pointer to a null-terminated string containing the hostname of the remote server.

port the port number of the server to which the connection will be established.

Returns:

NULL on failure or a pointer to a newly initialized network client object for the connection upon success.

Definition at line 70 of file clients.c.

References client_t, ip_t::family, FOREIGNDATA, ip_t::ip4, ip_t::ip6, JOINTED, log_pedantic, MEMORYBUF, mm_alloc(), mm_cleanup, mm_copy(), mm_free(), PLACER_T, st_alloc(), STACK, and status.

Referenced by net_trigger(), and smtp_client_connect().

5.155.2.4 int64_t client_print (client_t * *client*, chr_t * *format*, ...)

[write.c](#) [write.c](#)

See also:

[client_write\(\)](#)

Parameters:

client the network client connection to which the supplied data will be written.

format the format string for the data to be written to the network client connection.

... a va_arg style collection of variables to be expanded by the passed format string.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 258 of file write.c.

References client_write(), st_free(), and st_vaprint.

Referenced by smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

5.155.2.5 int64_t client_read (client_t * *client*)

[read.c](#) [read.c](#)

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 304 of file read.c.

References bytes, client_status(), ip_presentation(), log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), pl_length_get(), pl_null(), st_avail_get(), st_char_get(), st_data_get(), st_length_get(), st_length_int(), st_length_set(), status, tcp_status(), tls_cipher(), tls_error(), and tls_read().

5.155.2.6 int64_t client_read_line (client_t * client)

Read a line of input from a network client session.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 191 of file read.c.

References bytes, ip_presentation(), line_pl_st(), log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), pl_empty(), pl_length_get(), pl_null(), st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), st_length_set(), status, tcp_status(), tls_cipher(), tls_error(), and tls_read().

Referenced by smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

5.155.2.7 int_t client_secure (client_t * client)

Establish a TLS connection with a network client instance.

Parameters:

client a pointer to the network client object to have its transport security upgraded.

Returns:

-1 on failure or 0 on success.

Definition at line 45 of file clients.c.

References tls_client_alloc().

Referenced by smtp_client_connect().

5.155.2.8 int_t client_status (client_t * client)

Get the status of a network client.

Parameters:

client a pointer to the network client object to be queried.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 15 of file clients.c.

References tcp_status(), and tls_status().

Referenced by client_read(), and client_write().

5.155.2.9 int64_t client_write (client_t * client, stringer_t * s)

Write data to a network client.

Note:

This function works regardless of whether or not the client connection is ssl-enabled. If the network write requires multiple system calls, then this code will loop until all the data has been transmitted.

Parameters:

- client* the network client connection to which the supplied data will be written.
- s* a managed string containing the data to be written to the network client connection.

Returns:

- 1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 169 of file write.c.

References bytes, client_status(), ip_presentation(), length, log_pedantic, MANAGEDBUF, MEMORYBUF, st_char_get(), st_empty_out(), st_length_int(), status, tcp_status(), tls_cipher(), tls_error(), and tls_write().

Referenced by client_print(), smtp_client_close(), and smtp_client_send_data().

5.155.2.10 ip_t* con_addr (connection_t * con, ip_t * output)

[addresses.c](#) [addresses.c](#)

Parameters:

- con* the input client connection.
- output* a pointer to an [ip_t](#) structure to receive the remote IP address, which is allocated for the caller if output is NULL.

Returns:

- NULL on error, or a pointer to the IP address of the remote host.

Definition at line 16 of file addresses.c.

References ip_t::ip.

Referenced by con_addr_octet(), con_addr_presentation(), con_addr_reversed(), con_addr_segment(), con_addr_standard(), con_addr_subnet(), con_addr_word(), sess_create(), sess_get(), smtp_bypass_check(), and smtp_rcpt_to().

5.155.2.11 octet_t con_addr_octet (connection_t * con, int_t position)

Get a specified 8-bit octet of a connection's peer IP address.

Parameters:

- con* a pointer to the connection object to be examined.
- position* a zero-based index into the 8-bit octets that comprise the target IP address.

Returns:

- 1 on error, or the specified 8-bit octet of the passed address on success.

Definition at line 152 of file addresses.c.

References con_addr(), and ip_octet().

5.155.2.12 stringer_t* con_addr_presentation (connection_t * con, stringer_t * output)

Return a textual representation of the IP address of a specified connection handle.

Parameters:

- con* the remote connection to be queried.

output a managed string to store the result, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 62 of file addresses.c.

References con_addr(), and ip_presentation().

Referenced by api_endpoint_auth(), contact_abuse_checks(), contact_abuse_increment_history(), contact_business(), imap_id(), imap_login(), mail_add_inbound_headers(), mail_add_outbound_headers(), pop_pass(), portal_endpoint_auth(), portal_meta(), protocol_secure(), register_abuse_checks(), register_data_insert_user(), register_session_cache(), register_session_get(), smtp_auth_login(), smtp_auth_plain(), and smtp_rcpt_to().

5.155.2.13 stringer_t* con_addr_reversed (connection_t * con, stringer_t * output)

Get the reversed-IP address string for a client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if passed as NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address on success.

Definition at line 98 of file addresses.c.

References con_addr(), and ip_reversed().

Referenced by smtp_check_greylist(), and smtp_check_rbl().

5.155.2.14 segment_t con_addr_segment (connection_t * con, int_t position)

Extract a specified 16 bit segment from a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position the zero-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 170 of file addresses.c.

References con_addr(), and ip_segment().

5.155.2.15 stringer_t* con_addr_standard (connection_t * con, stringer_t * output)

Get the IP address string for the client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 80 of file addresses.c.

References `con_addr()`, and `ip_standard()`.

Referenced by `register_abuse_check_blocklist()`, `register_abuse_checks()`, and `register_abuse_increment_history()`.

5.155.2.16 stringer_t* con_addr_subnet (connection_t * con, stringer_t * output)

Get the subnet string for a specified connection.

Parameters:

con the client connection to be queried.

output a managed string that will store the output of the subnet string lookup.

Returns:

NULL on failure, or a managed string containing a textual representation of a subnet address on success.

Definition at line 116 of file addresses.c.

References `con_addr()`, and `ip_subnet()`.

Referenced by `api_endpoint_auth()`, `imap_login()`, `pop_pass()`, `portal_endpoint_auth()`, `smtp_auth_login()`, `smtp_auth_plain()`, `smtp_check_receive_quota()`, and `smtp_update_receive_stats()`.

5.155.2.17 uint32_t con_addr_word (connection_t * con, int_t position)

Get a specified 32-bit segment of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

-1 if the connecting address can't be looked up, 0 on general error, or the specified 32-bit segment of the passed address on success.

Definition at line 134 of file addresses.c.

References `con_addr()`, and `ip_word()`.

5.155.2.18 uint64_t con_decrement_refs (connection_t * con)

[connections.c](#) [connections.c](#)

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 210 of file connections.c.

References `mutex_lock()`, and `mutex_unlock()`.

Referenced by `con_destroy()`.

5.155.2.19 void con_destroy (connection_t * con)

Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.

Parameters:

con a pointer to the connection to be destroyed.

Returns:

This function returns no value.

Definition at line 104 of file connections.c.

References con_decrement_refs(), DMTP, dmtplib_session_destroy(), HTTP, http_session_destroy(), IMAP, imap_session_destroy(), mm_cleanup, mm_free(), MOLTEN, molten_session_destroy(), mutex_destroy(), POP, pop_session_destroy(), SMTP, smtp_session_destroy(), st_cleanup, stats_decrement_by_name(), SUBMISSION, and tls_free().

Referenced by con_reverse_lookup(), dmtplib_quit(), http_close(), imap_logout(), molten_quit(), pop_quit(), protocol_enqueue(), and smtp_quit().

5.155.2.20 void con_flush (connection_t * con)

Attempt to flush any buffered data associated with a network connection.

Parameters:

con the input client connection.

Returns:

This function returns no value.

Definition at line 89 of file connections.c.

References net_set_nodelay().

Referenced by smtp_quit().

5.155.2.21 uint64_t con_increment_refs (connection_t * con)

Increment a connection object's reference counter.

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 194 of file connections.c.

References mutex_lock(), and mutex_unlock().

Referenced by con_init().

5.155.2.22 connection_t* con_init (int cond, server_t * server)

Create a new connection object for a client connection.

Parameters:

cond the socket descriptor of the inbound client connection that was just accepted.

server the handle of the server that serviced the inbound request.

Definition at line 250 of file connections.c.

References `con_increment_refs()`, `connection_t`, `mm_alloc()`, `mm_free()`, `mutex_init()`, `server_t::network`, `server_t::sockd`, and `tcp_addr_ip()`.

Referenced by `protocol_process()`.

5.155.2.23 bool_t con_init_network_buffer (connection_t * con)

Allocate and initialize a new network buffer for a connection, if it is not already associated with one.

Note:

A network buffer of size `magma.system.network_buffer` bytes will be allocated for the connection if one does not exist.

Returns:

true if the connection object has been associated with a network buffer or false on failure.

Definition at line 226 of file connections.c.

References `log_info`, `magma`, `magma_t::network_buffer`, `pl_null()`, `st_alloc()`, and `magma_t::system`.

Referenced by `con_read()`, and `con_read_line()`.

5.155.2.24 bool_t con_localhost (connection_t * con)

Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.

See also:

[ip_localhost\(\)](#)

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 32 of file connections.c.

References `ip_localhost()`.

Referenced by `json_api_dispatch()`, `portal_endpoint()`, `portal_endpoint_auth()`, `portal_process()`, and `portal_upload()`.

5.155.2.25 int64_t con_print (connection_t * con, chr_t * format, ...)

Write a formatted string to a network connection.

See also:

[con_write_bl\(\)](#)

Parameters:

con the connection across which the supplied data will be written.

format a format string for the output string to be written to the connection's remote client.

... a variable argument list of parameters for the specified format string.

Returns:

-1 on general failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 112 of file write.c.

References `buflen`, `bufptr`, `bytes`, `con_write_bl()`, `length`, `mm_alloc()`, and `mm_free()`.

Referenced by `dmtpl_ahlo()`, `dmtpl_helo()`, `dmtpl_init()`, `http_parse_header()`, `http_print_301()`, `http_response_header()`, `http_response_options()`, `imap_append()`, `imap_capability()`, `imap_check()`, `imap_close()`, `imap_copy()`, `imap_create()`, `imap_delete()`, `imap_examine()`, `imap_expunge()`, `imap_fetch()`, `imap_id()`, `imap_idle()`, `imap_init()`, `imap_invalid()`, `imap_list()`, `imap_login()`, `imap_logout()`, `imap_lsub()`, `imap_noop()`, `imap_process()`, `imap_rename()`, `imap_search()`, `imap_select()`, `imap_starttls()`, `imap_status()`, `imap_store()`, `imap_subscribe()`, `imap_unsubscribe()`, `molten_stats()`, `pop_capa()`, `pop_last()`, `pop_list()`, `pop_retr()`, `pop_stat()`, `pop_top()`, `pop_uidl()`, `register_print_captcha()`, `smtp_data()`, `smtp_data_inbound()`, `smtp_data_outbound()`, `smtp_disabled()`, `smtp_ahlo()`, `smtp_helo()`, `smtp_init()`, `smtp_rcpt_to()`, and `teacher_print_message()`.

5.155.2.26 bool_t con_private (connection_t * con)

Determine whether a client connection is with a machine on the same private network.

See also:

[ip_private\(\)](#)

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 48 of file connections.c.

References `ip_localhost()`.

5.155.2.27 int64_t con_read (connection_t * con)

Read data from a network connection, and store the data in the connection context buffer.

Note:

This function handles reading data from both regular and SSL connections. If the connection's network buffer hasn't been allocated, it will be initialized.

Parameters:

con a pointer to the connection object from which the data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 108 of file read.c.

References `bytes`, `con_init_network_buffer()`, `con_status()`, `mm_move()`, `pl_length_get()`, `pl_null()`, `st_avail_get()`, `st_char_get()`, `st_data_get()`, `st_length_get()`, `st_length_set()`, `status`, `tcp_read()`, and `tls_read()`.

Referenced by `http_body()`, `imap_parse_literal()`, `smtp_data_finish()`, and `smtp_data_read()`.

5.155.2.28 int64_t con_read_line (connection_t * con, bool_t block)

Read a line of input from a network connection.

Note:

This function handles reading data from both regular and ssl connections. This function continually attempts to read incoming data from the specified connection until a terminated line of input is received. If a new line is read, the length of that line is returned to the caller, including the trailing . If the read returns -1 and wasn't caused by a syscall interruption or blocking error, -1 is returned, and the connection status is set to -1. If the read returns 0 and wasn't caused by a syscall interruption or blocking error, -2 is returned, and the connection status is set to 2. Once a character is reached, the length of the current line of input is returned to the user, and the connection status is set to 1.

Parameters:

con the network connection across which the line of data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 21 of file read.c.

References bytes, con_init_network_buffer(), con_status(), line_pl_st(), mm_move(), pl_empty(), pl_length_get(), pl_null(), st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_set(), status, tcp_read(), and tls_read().

Referenced by dmtcp_process(), http_process(), imap_parse_literal(), imap_process(), molten_parse(), pop_process(), smtp_auth_login(), smtp_auth_plain(), and smtp_process().

5.155.2.29 stringer_t* con_reverse_check (connection_t * con, uint32_t timeout)

[reverse.c](#) [reverse.c](#)

Note:

Polling will occur every 100ms, for as many seconds as specified by the user.

Parameters:

con the specified connection object to be polled that is the target of the DNS lookup.

timeout the number of seconds to wait for the lookup operation to complete.

Returns:

NULL on failure, or a pointer to a managed string containing the connection's peer hostname on success.

Definition at line 75 of file reverse.c.

References mutex_lock(), mutex_unlock(), REVERSE_COMPLETE, REVERSE_PENDING, and status.

Referenced by mail_add_inbound_headers(), and mail_add_outbound_headers().

5.155.2.30 void con_reverse_domain (connection_t * con, stringer_t * domain, int_t status)

Set the domain name and reverse lookup status of a connection.

Note:

Possible values for status include REVERSE_ERROR, REVERSE_EMPTY, REVERSE_PENDING, and REVERSE_COMPLETE.

Parameters:

domain the new value of the connection's hostname.

status the new value of the connection's reverse lookup status.

Returns:

This function returns no value.

Definition at line 42 of file reverse.c.

References mutex_lock(), and mutex_unlock().

Referenced by con_reverse_lookup().

5.155.2.31 void con_reverse_enqueue (connection_t * con)

Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.

Parameters:

con the connection object to be examined.

Returns:

This function returns no value.

Definition at line 15 of file reverse.c.

References con_reverse_lookup(), enqueue(), mutex_lock(), mutex_unlock(), REVERSE_EMPTY, and REVERSE_PENDING.

Referenced by dmtip_init(), http_init(), imap_init(), and smtp_init().

5.155.2.32 void con_reverse_lookup (connection_t * con)

Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

Parameters:

con the connection object to be queried.

Returns:

This function returns no value.

Definition at line 107 of file reverse.c.

References con_destroy(), con_reverse_domain(), con_reverse_status(), MEMORYBUF, ns_length_get(), REVERSE_COMPLETE, REVERSE_ERROR, and st_import().

Referenced by con_reverse_enqueue().

5.155.2.33 void con_reverse_status (connection_t * con, int_t status)

Definition at line 59 of file reverse.c.

References mutex_lock(), and mutex_unlock().

Referenced by con_reverse_lookup().

5.155.2.34 int_t con_secure (connection_t * con)

Return the security level of a specified connection.

Parameters:

con the input client connection.

Returns:

1 for a secure connection, 0 for insecure, and -1 if the server does not support SSL/TLS.

Definition at line 15 of file connections.c.

Referenced by `contact_process()`, `http_print_301()`, `http_response_cookie()`, `imap_capability()`, `imap_init()`, `imap_login()`, `imap_starttls()`, `json_api_dispatch()`, `pop_capa()`, `pop_pass()`, `pop_starttls()`, `portal_endpoint()`, `portal_endpoint_auth()`, `portal_process()`, `portal_upload()`, `protocol_enqueue()`, `register_process()`, `sess_create()`, `sess_get()`, `smtp_ehlo()`, `smtp_rcpt_to()`, `smtp_starttls()`, and `teacher_process()`.

5.155.2.35 int_t con_status (connection_t * con)

Return the status of a specified connection.

Parameters:

con the input client connection.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 64 of file connections.c.

References `tcp_status()`, and `tls_status()`.

Referenced by `con_read()`, `con_read_line()`, `con_write_bl()`, `dmtip_quit()`, `dmtip_requeue()`, `http_requeue()`, `imap_fetch()`, `imap_logout()`, `imap_requeue()`, `pop_quit()`, `pop_requeue()`, `smtp_quit()`, and `smtp_requeue()`.

5.155.2.36 int64_t con_write_bl (connection_t * con, char * block, size_t length)

Write data to a network connection. **HIGH:** Create a simpler method of triggering a queue event following a connection write operation, and audit the code to ensure write calls do not accidentally orphan a connection by not queuing the connection upon completion. In other words, always ensure that `enqueue()` is being called on a connection after all processing is performed, so that it is not lost (whether it is to be kept or not).

Note:

This function works regardless of whether or not the connection is ssl-enabled. If the network write requires multiple system calls, then this code will loop until all the data has been transmitted.

Parameters:

con the connection across which the supplied data will be written.

block a pointer to a data buffer containing the data to be written to the connection's remote client.

length the length, in bytes, of the data buffer to be written.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 24 of file write.c.

References `bytes`, `con_status()`, `status`, `tcp_write()`, and `tls_write()`.

Referenced by `con_print()`, `con_write_ns()`, `con_write_pl()`, `con_write_st()`, `dmtip_data()`, `dmtip_help()`, `dmtip_hist()`, `dmtip_invalid()`, `dmtip_mail()`, `dmtip_mode()`, `dmtip_noop()`, `dmtip_quit()`, `dmtip_rcpt()`, `dmtip_rset()`, `dmtip_sgnt()`, `dmtip_verb()`, `dmtip_vrfy()`, `imap_fetch()`, `imap_logout()`, `imap_parse_literal()`, `imap_process()`, `molten_invalid()`, `molten_stats()`, `pop_delete()`, `pop_init()`, `pop_invalid()`, `pop_list()`, `pop_noop()`, `pop_pass()`, `pop_quit()`, `pop_retr()`, `pop_rset()`, `pop_starttls()`, `pop_top()`, `pop_uidl()`, `pop_user()`, `smtp_auth_login()`, `smtp_auth_plain()`, `smtp_data()`, `smtp_data_inbound()`, `smtp_data_outbound()`, `smtp_ehlo()`, `smtp_helo()`, `smtp_invalid()`, `smtp_mail_from()`, `smtp_noop()`, `smtp_quit()`, `smtp_rcpt_to()`, `smtp_rset()`, and `smtp_starttls()`.

5.155.2.37 int64_t con_write_ns (connection_t * con, char * string)

Write a null-terminated string to a network connection.

See also:

[con_write_bl\(\)](#)

Parameters:

con the connection across which the supplied data will be written.

string a pointer to a null-terminated string containing the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 89 of file write.c.

References [con_write_bl\(\)](#), and [ns_length_get\(\)](#).

5.155.2.38 int64_t con_write_pl (connection_t * con, placer_t string)

Write a placer to a network connection.

See also:

[con_write_bl\(\)](#)

Parameters:

con the connection across which the supplied data will be written.

string a placer pointing to the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 100 of file write.c.

References [con_write_bl\(\)](#), [pl_char_get\(\)](#), and [pl_length_get\(\)](#).

5.155.2.39 int64_t con_write_st (connection_t * con, stringer_t * string)

Write a managed string to a network connection.

See also:

[con_write_bl\(\)](#)

Parameters:

con the connection across which the supplied data will be written.

string a managed string containing the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 78 of file write.c.

References `con_write_bl()`, `st_char_get()`, and `st_length_get()`.

Referenced by `api_response()`, `contact_print_form()`, `contact_print_message()`, `http_print_400()`, `http_print_403()`, `http_print_404()`, `http_print_405()`, `http_print_500()`, `http_print_500_log()`, `http_print_501()`, `http_response()`, `imap_fetch()`, `imap_search()`, `pop_retr()`, `pop_top()`, `portal_endpoint_attachments_progress()`, `portal_endpoint_error()`, `portal_endpoint_response()`, `portal_endpoint_search()`, `portal_print_login()`, `register_print_captcha()`, `register_print_message()`, `register_print_step1()`, `register_print_step2()`, `register_print_step3()`, `smtp_data_outbound()`, `statistics_process()`, `teacher_print_form()`, and `teacher_print_message()`.

5.155.2.40 `bool_t net_init (server_t * server)`

[listeners.c](#)

Definition at line 58 of file listeners.c.

References `server_t::ipv6`, `server_t::listen_queue`, `log_critical`, `magma`, `mm_wipe()`, `net_set_buffer_length()`, `net_set_reuseable_address()`, `server_t::network`, `magma_t::network_buffer`, `server_t::port`, `server_t::sockd`, and `magma_t::system`.

Referenced by `servers_network_start()`.

5.155.2.41 `void net_listen (void)`

Definition at line 33 of file listeners.c.

References `server_t::enabled`, `magma`, `MAGMA_SERVER_INSTANCES`, `mm_free()`, `mm_wipe()`, `net_accept()`, `server_t::network`, `magma_t::servers`, `server_t::sockd`, `thread_alloc()`, and `thread_join()`.

Referenced by `main()`.

5.155.2.42 `bool_t net_set_blocking (int sd, bool_t blocking)`

Set the blocking flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

blocking a boolean, where true indicates the socket should be configured to use blocking system calls, and false to indicate the socket should use non-blocking calls.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 103 of file options.c.

References `buflen`, `bufptr`, `log_error`, and `log_pedantic`.

5.155.2.43 `bool_t net_set_buffer_length (int sd, int buffer_recv, int buffer_send)`

[options.c](#) [options.c](#)

Parameters:

sd the socket descriptor to be configured.

buffer_recv the length, in bytes, of the socket receive buffer.

buffer_send the length, in bytes, of the socket send buffer.

Returns:

true if both buffer values were set successfully, or false on failure.

Definition at line 163 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.155.2.44 bool_t net_set_keepalive (int sd, bool_t keepalive, int_t idle, int_t interval, int_t tolerance)

Set the keepalive flag, the. Controls whether to send periodic messages along idle socket connections to ensure the connected peer is still present. If the peer fails to respond the connection can be broken.

Parameters:

sd The socket being configured.

keepalive Whether to enable the keepalive process.

idle Controls how long a connection must be idle (in seconds) before the system will start sending keep alive probes.

interval They delay (in seconds) between each keep alive probe.

tolerance The maximum number of failed probes that must be sent before dropping a connection.

Returns:

Returns true if all the parameters are configured properly, otherwise false to indicate an error.

Definition at line 23 of file options.c.

References buflen, bufptr, and log_pedantic.

5.155.2.45 bool_t net_set_linger (int sd, bool_t linger, int_t timeout)

Set the linger flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

linger a boolean variable specifying whether the socket will linger before closing until all queued messages for the socket have been sent.

timeout a value specifying the number of seconds to linger, if linger is true.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 63 of file options.c.

References buflen, bufptr, and log_pedantic.

5.155.2.46 bool_t net_set_nodelay (int sd, bool_t nodelay)

Set the delay flag for a socket (to disable the Nagle algorithm).

Parameters:

sd the socket descriptor to be adjusted.

nodelay a boolean variable specifying whether the Nagle algorithm should be disabled (true) or not (false).

Returns:

true if the flag was successfully set or false on failure.

Definition at line 44 of file options.c.

References `buflen`, `bufptr`, and `log_pedantic`.

Referenced by `con_flush()`.

5.155.2.47 `bool_t net_set_reuseable_address (int sd, bool_t reuse)`

Set the reusable flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

reuse a boolean variable specifying whether the listening socket should be reusable or not.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 84 of file options.c.

References `buflen`, `bufptr`, and `log_pedantic`.

Referenced by `net_init()`.

5.155.2.48 `bool_t net_set_timeout (int sd, uint32_t timeout_rcv, uint32_t timeout_send)`

Set the send and receive timeouts for a socket.

Parameters:

sd the socket descriptor to be configured.

timeout_rcv the receive timeout value for the socket, in seconds.

timeout_send the send timeout value for the socket, in seconds.

Returns:

true if both timeout values were set successfully, or false on failure.

Definition at line 131 of file options.c.

References `buflen`, `bufptr`, `log_pedantic`, and `mm_wipe()`.

Referenced by `protocol_process()`, and `smtp_client_connect()`.

5.155.2.49 `void net_shutdown (server_t * server)`

Close the listening socket associated with a server.

Returns:

This function returns no value.

Definition at line 216 of file listeners.c.

References `server_t::network`, and `server_t::sockd`.

Referenced by `servers_network_stop()`.

5.155.2.50 `void net_trigger (bool_t verbose)`

Triggers a connection for each server instance, allowing the the listeners to shutdown cleanly. And then purges any remaining sockets.

LOW: This only compares the port number for the sockets. We should also ensure the socket is owned by magmad, and/or that the server used INADDR_ANY or IN6ADDR_ANY_INIT, otherwise the logic below will close sockets that could be owned by other processes on the system that are using the same port number, while bound to a different IP interface.

Definition at line 129 of file listeners.c.

Functions

- **PUBLIC_FUNC_DECL** (int, connect_host, const char *hostname, unsigned short port, int force_family)
- int **_connect_timeout** (int fd, const struct sockaddr *addr, socklen_t addrlen)

Attempt a TCP connection with a time-out mechanism.

5.156.1 Function Documentation

5.156.1.1 int _connect_timeout (int fd, struct sockaddr const * addr, socklen_t addrlen)

Attempt a TCP connection with a time-out mechanism.

Parameters:

- fd** the open socket descriptor across which the connection will be attempted.
- addr** a pointer to the prepared sockaddr structure that is the target of the connection.
- addrlen** the size of the supplied sockaddr structure.

Returns:

- 1 on general error, 0 if the connection failed or timed out, and 1 on success.

Definition at line 113 of file network.c.

References CONNECT_TIMEOUT, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

Referenced by _connect_host().

Set the send and receive buffers for a socket at the system level.

5.157.1 Function Documentation

5.157.1.1 bool_t net_set_blocking (int sd, bool_t blocking)

Set the blocking flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

blocking a boolean, where true indicates the socket should be configured to use blocking system calls, and false to indicate the socket should use non-blocking calls.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 103 of file options.c.

References [buflen](#), [bufptr](#), [log_error](#), and [log_pedantic](#).

5.157.1.2 bool_t net_set_buffer_length (int sd, int buffer_recv, int buffer_send)

Set the send and receive buffers for a socket at the system level. [options.c](#)

Parameters:

sd the socket descriptor to be configured.

buffer_recv the length, in bytes, of the socket receive buffer.

buffer_send the length, in bytes, of the socket send buffer.

Returns:

true if both buffer values were set successfully, or false on failure.

Definition at line 163 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.157.1.3 bool_t net_set_keepalive (int sd, bool_t keepalive, int_t idle, int_t interval, int_t tolerance)

Set the keepalive flag, the. Controls whether to send periodic messages along idle socket connections to ensure the connected peer is still present. If the peer fails to respond the connection can be broken.

Parameters:

sd The socket being configured.

keepalive Whether to enable the keepalive process.

idle Controls how long a connection must be idle (in seconds) before the system will start sending keep alive probes.

interval They delay (in seconds) between each keep alive probe.

tolerance The maximum number of failed probes that must be sent before dropping a connection.

Returns:

Returns true if all the parameters are configured properly, otherwise false to indicate an error.

Definition at line 23 of file options.c.

References buflen, bufptr, and log_pedantic.

5.157.1.4 bool_t net_set_linger (int sd, bool_t linger, int_t timeout)

Set the linger flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

linger a boolean variable specifying whether the socket will linger before closing until all queued messages for the socket have been sent.

timeout a value specifying the number of seconds to linger, if linger is true.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 63 of file options.c.

References buflen, bufptr, and log_pedantic.

5.157.1.5 **bool_t net_set_nodelay (int *sd*, bool_t *nodelay*)**

Set the delay flag for a socket (to disable the Nagle algorithm).

Parameters:

sd the socket descriptor to be adjusted.

nodelay a boolean variable specifying whether the Nagle algorithm should be disabled (true) or not (false).

Returns:

true if the flag was successfully set or false on failure.

Definition at line 44 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by con_flush().

5.157.1.6 **bool_t net_set_reuseable_address (int *sd*, bool_t *reuse*)**

Set the reusable flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

reuse a boolean variable specifying whether the listening socket should be reusable or not.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 84 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.157.1.7 **bool_t net_set_timeout (int *sd*, uint32_t *timeout_rcv*, uint32_t *timeout_snd*)**

Set the send and receive timeouts for a socket.

Parameters:

sd the socket descriptor to be configured.

timeout_rcv the receive timeout value for the socket, in seconds.

timeout_snd the send timeout value for the socket, in seconds.

Returns:

true if both timeout values were set successfully, or false on failure.

Definition at line 131 of file options.c.

References buflen, bufptr, log_pedantic, and mm_wipe().

Referenced by protocol_process(), and smtp_client_connect().

Reset the user's mailbox, in response to a POP3 RSET command.
- void `pop_starttls` (`connection_t *con`)
TODO: Review error messages and update them with the appropriate response code, as per RFC 3206 regarding the response codes extension.
- void `pop_stat` (`connection_t *con`)
Display a user's message statistics, in response to a POP3 STAT command.
- void `pop_top` (`connection_t *con`)
Get the top lines of a message or collection of messages, in response to a POP3 TOP command.
- void `pop_uidl` (`connection_t *con`)
Get the UIDL for a message or collection of messages, in response to a POP3 UIDL command.
- void `pop_user` (`connection_t *con`)
Accept a username for POP3 authentication.
- void `pop_session_destroy` (`connection_t *con`)
sessions.c
- `int_t pop_session_reset` (`connection_t *con`)
Reset a POP3 session by guaranteeing that no messages are flagged to be deleted.

5.159.1 Function Documentation

5.159.1.1 void `pop_capa` (`connection_t *con`)

`pop.c pop.c`

Note:

See RFC 2449 POP3 Extension Mechanism for details.

Parameters:

`con` the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 342 of file pop.c.

References build_version(), con_print(), and con_secure().

5.159.1.2 int_t pop_compare (const void * *compare*, const void * *command*)

commands.c

Definition at line 11 of file commands.c.

References command_t, PLACER, st_cmp_ci_eq(), and st_cmp_ci_starts().

Referenced by pop_process(), and pop_sort().

5.159.1.3 void pop_dele (connection_t * *con*)

Get a message, in response to a POP3 DELE command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 478 of file pop.c.

References con_write_bl(), MAIL_STATUS_HIDDEN, meta_message_t, meta_user_unlock(), meta_user_wlock(), number, pop_get_message(), pop_invalid(), and pop_num_parse().

5.159.1.4 uint64_t pop_get_last (inx_t * *messages*)

[mailbox.c](#) [mailbox.c](#)

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the sequence number of the last message that isn't flagged as recent, or 0 on failure.

Definition at line 74 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, MAIL_STATUS_RECENT, and meta_message_t.

Referenced by pop_last().

5.159.1.5 meta_message_t* pop_get_message (inx_t * *messages*, uint64_t *get*)

Get a message by its pop sequence number.

Parameters:

messages an inx holder containing the collection of the user's messages to be traversed.

number the zero-based pop sequence number of the message to be retrieved.

Returns:

NULL on failure or the meta message object of the message if it was found.

Definition at line 113 of file mailbox.c.

References `count`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `MAIL_STATUS_APPENDED`, and `meta_message_t`.

Referenced by `pop_dele()`, `pop_list()`, `pop_retr()`, `pop_top()`, and `pop_uidl()`.

5.159.1.6 void pop_init (connection_t * con)

Initialize a new POP3 connection.

Parameters:

con the newly connected POP3 client connection.

Returns:

This function returns no value.

Definition at line 723 of file pop.c.

References `con_write_bl()`, and `pop_requeue()`.

Referenced by `protocol_enqueue()`.

5.159.1.7 void pop_invalid (connection_t * con)

A function handler for invalid POP3 commands.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 67 of file pop.c.

References `con_write_bl()`.

Referenced by `pop_dele()`, `pop_last()`, `pop_list()`, `pop_pass()`, `pop_process()`, `pop_retr()`, `pop_rset()`, `pop_starttls()`, `pop_stat()`, `pop_top()`, `pop_uidl()`, and `pop_user()`.

5.159.1.8 void pop_last (connection_t * con)

Get the sequence number of the last read message, in response to a POP3 LAST command.

See also:

[pop_get_last\(\)](#)

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 390 of file pop.c.

References `con_print()`, `meta_user_rlock()`, `meta_user_unlock()`, `number`, `pop_get_last()`, and `pop_invalid()`.

5.159.1.9 void pop_list (connection_t * con)

Get the list of a user's messages, in response to a POP3 LIST command.

See also:

[pop_total_messages\(\)](#), [pop_get_message\(\)](#)

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 415 of file pop.c.

References `con_print()`, `con_write_bl()`, `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `MAIL_STATUS_APPENDED`, `MAIL_STATUS_HIDDEN`, `meta_message_t`, `meta_user_rlock()`, `meta_user_unlock()`, `number`, `pop_get_message()`, `pop_invalid()`, `pop_num_parse()`, and `pop_total_messages()`.

5.159.1.10 void pop_noop (connection_t * con)

Execute a POP3 no-operation command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 56 of file pop.c.

References `con_write_bl()`.

5.159.1.11 bool_t pop_num_parse (connection_t * con, uint64_t * outnum, bool_t required)

parse.c parse.c

Parameters:

con the connection across which the pop command was issued.

outnum a pointer to an unsigned 64-bit integer to receive the numerical argument of the pop command on success.

required specifies whether or not a parameter is required.

Returns:

true if the pop command contained a valid unsigned number or false on failure.

Definition at line 17 of file parse.c.

References `length`, `log_pedantic`, `st_data_get()`, `st_length_get()`, and `uint64_conv_bl()`.

Referenced by `pop_dele()`, `pop_list()`, `pop_retr()`, and `pop_uidl()`.

5.159.1.12 void pop_pass (connection_t * con)

Accept and verify a password for POP3 authentication.

Note:

This command is only allowed for sessions which have not yet been authenticated, but which have already supplied a username. If the username/password combo was validated, the account information is retrieved and checked to see if it is locked. After successful authentication, this function will prohibit insecure connections for any user configured to use TLS only, and enforce the existence of only one POP3 session at a time. Finally, the database Log table for this user's POP3 access is updated, and all the user's messages are retrieved.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 168 of file pop.c.

References `auth_free()`, `AUTH_LOCK_ABUSE`, `AUTH_LOCK_ADMIN`, `AUTH_LOCK_EXPIRED`, `AUTH_LOCK_USER`, `auth_login()`, `cache_decrement()`, `cache_increment()`, `con_addr_presentation()`, `con_addr_subnet()`, `con_secure()`, `con_write_bl()`, `inx_count()`, `auth_t::keys`, `lock_get()`, `lock_release()`, `auth_t::locked`, `log_info`, `MANAGEDBUF`, `auth_t::master`, `meta_data_update_log()`, `meta_get()`, `META_GET_KEYS`, `META_GET_MESSAGES`, `meta_inx_remove()`, `META_LOCKED`, `meta_messages_login_update()`, `META_PROTOCOL_POP`, `META_USER_ENCRYPT_DATA`, `meta_user_ref_protocol_total()`, `META_USER_TLS`, `meta_user_unlock()`, `meta_user_wlock()`, `pop_invalid()`, `pop_pass_parse()`, `auth_t::salt`, `auth_t::seasoning`, `st_char_get()`, `st_dupe()`, `st_empty`, `st_free()`, `st_length_int()`, `st_populated`, `st_quick()`, `auth_t::status`, `time_datestamp()`, `auth_t::tokens`, `auth_t::username`, `auth_t::usernum`, and `auth_t::verification`.

5.159.1.13 stringer_t* pop_pass_parse (connection_t * con)

Parse a POP3 PASS command.

Note:

This function will stop reading in password characters when an invalid character is encountered.

Parameters:

con the POP3 client connection that issued the PASS command.

Returns:

a managed string containing the user supplied password, or NULL on failure.

Definition at line 191 of file parse.c.

References `CONTIGUOUS`, `length`, `log_error`, `log_pedantic`, `MANAGED_T`, `SECURE`, `st_alloc_opts()`, `st_copy_in()`, `st_data_get()`, and `st_length_get()`.

Referenced by `pop_pass()`.

5.159.1.14 void pop_process (connection_t * con)

Definition at line 43 of file commands.c.

References command, command_t, con_read_line(), enqueue(), pl_char_get(), pl_empty(), pl_length_get(), pop_commands, pop_compare(), pop_invalid(), pop_process(), pop_quit(), pop_requeue(), and requeue().

Referenced by pop_process(), and pop_requeue().

5.159.1.15 void pop_quit (connection_t * con)

Gracefully destroy a POP3 session, whether because of an error or in response to a user QUIT command.

Parameters:

con the POP3 client connection to be shut down. This function returns no value.

Definition at line 107 of file pop.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by pop_process(), and pop_requeue().

5.159.1.16 void pop_requeue (connection_t * con)

Definition at line 31 of file commands.c.

References con_status(), enqueue(), pop_process(), pop_quit(), and status.

Referenced by pop_init(), and pop_process().

5.159.1.17 void pop_retr (connection_t * con)

Retrieve a user's message, in response to a POP3 RETR command.

Note:

This function will fail if a deleted message was specified by the user.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 653 of file pop.c.

References con_print(), con_write_bl(), con_write_st(), mail_destroy(), mail_load_message(), MAIL_STATUS_HIDDEN, meta_message_t, meta_user_rlock(), meta_user_unlock(), number, PLACER, pop_get_message(), pop_invalid(), pop_num_parse(), st_char_get(), st_length_get(), st_replace(), and mail_message_t::text.

5.159.1.18 void pop_rset (connection_t * con)

Reset the user's mailbox, in response to a POP3 RSET command.

See also:

[pop_session_reset\(\)](#)

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 82 of file pop.c.

References `con_write_bl()`, `pop_invalid()`, and `pop_session_reset()`.

5.159.1.19 void pop_session_destroy (connection_t * con)

sessions.c sessions.c

Parameters:

con the POP3 client connection issuing the command. This function returns no value.

Definition at line 50 of file sessions.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `inx_delete()`, `M_TYPE_UINT64`, `mail_cache_reset()`, `mail_remove_message()`, `MAIL_STATUS_HIDDEN`, `meta_inx_remove()`, `meta_message_t`, `meta_messages_update_sequences()`, `META_PROTOCOL_POP`, `meta_user_unlock()`, `meta_user_wlock()`, `OBJECT_MESSAGES`, `serial_increment()`, `st_cleanup`, `multi_t::u64`, and `multi_t::val`.

Referenced by `con_destroy()`.

5.159.1.20 int_t pop_session_reset (connection_t * con)

Reset a POP3 session by guaranteeing that no messages are flagged to be deleted.

Parameters:

con the POP3 client connection issuing the command.

Returns:

-1 on general error, 0 if the connection hasn't been authenticated, or 1 if all messages have had their statuses successfully reset.

Definition at line 15 of file sessions.c.

References `inx_cursor_alloc()`, `inx_cursor_free()`, `inx_cursor_t`, `inx_cursor_value_next()`, `MAIL_STATUS_HIDDEN`, `meta_message_t`, `meta_user_unlock()`, and `meta_user_wlock()`.

Referenced by `pop_rset()`, and `pop_starttls()`.

5.159.1.21 void pop_sort (void)

Sort the POP3 command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 26 of file commands.c.

References `command_t`, `pop_commands`, and `pop_compare()`.

Referenced by `protocol_init()`.

5.159.1.22 void pop_starttls (connection_t * con)

TODO: Review error messages and update them with the appropriate response code, as per RFC 3206 regarding the response codes extension. Initialize a TLS session for an unauthenticated POP3 session.

Note:

RFC 2595 / section 4 dictates that the STLS/STARTTLS command should only be available in the authorization state.

Parameters:

con the connection of the POP3 client requesting the transport layer security upgrade.

Returns:

This function returns no value (all error messages are written directly to the requesting client).

Definition at line 18 of file pop.c.

References con_secure(), con_write_bl(), log_pedantic, M_SSL_BIO_NOCLOSE, pl_null(), pop_invalid(), pop_session_reset(), st_length_set(), stats_increment_by_name(), and tls_server_alloc().

5.159.1.23 void pop_stat (connection_t * con)

Display a user's message statistics, in response to a POP3 STAT command.

See also:

[pop_total_messages\(\)](#), [pop_total_size\(\)](#)

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 364 of file pop.c.

References con_print(), count, meta_user_rlock(), meta_user_unlock(), pop_invalid(), pop_total_messages(), and pop_total_size().

5.159.1.24 void pop_top (connection_t * con)

Get the top lines of a message or collection of messages, in response to a POP3 TOP command.

Note:

This function will fail if a deleted message was specified by the user.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 582 of file pop.c.

References con_print(), con_write_bl(), con_write_st(), mail_destroy(), mail_load_message_top(), MAIL_STATUS_HIDDEN, meta_message_t, meta_user_rlock(), meta_user_unlock(), number, PLACER, pop_get_message(), pop_invalid(), pop_top_parse(), st_char_get(), st_length_get(), st_replace(), and mail_message_t::text.

5.159.1.25 bool_t pop_top_parse (connection_t * con, uint64_t * number, uint64_t * lines)

Parse the arguments to a POP3 TOP command.

Parameters:

con the POP3 client connection that issued the TOP command.

number a pointer to an unsigned 64 bit integer to receive the value of the TOP command's message sequence number.

lines a pointer to an unsigned 64 bit integer to receive the value of the TOP command's line number count.

Returns:

true on success or false if an error was encountered.

Definition at line 89 of file parse.c.

References length, log_pedantic, st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by pop_top().

5.159.1.26 uint64_t pop_total_messages (inx_t * messages)

Get the number of messages available to a POP3 user.

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the total number of messages available to the POP3 user, or 0 on failure.

Definition at line 16 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, and meta_message_t.

Referenced by pop_list(), pop_stat(), and pop_uidl().

5.159.1.27 uint64_t pop_total_size (inx_t * messages)

Get the total size of all messages available to a POP3 user.

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the total size, in bytes, of all messages available to the POP3 user, or 0 on failure.

Definition at line 45 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, and meta_message_t.

Referenced by pop_stat().

5.159.1.28 void pop_uidl (connection_t * con)

Get the UIDL for a message or collection of messages, in response to a POP3 UIDL command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 517 of file pop.c.

References con_print(), con_write_bl(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, meta_message_t, meta_user_rlock(), meta_user_unlock(), number, pop_get_message(), pop_invalid(), pop_num_parse(), and pop_total_messages().

5.159.1.29 void pop_user (connection_t * con)

Accept a username for POP3 authentication.

Note:

This command is only allowed for sessions which have not yet been authenticated. If the username has already been supplied pre-authentication, the old value will be overwritten with the new one.

Parameters:

con the POP3 client connection issuing the command. This function returns no value.

Definition at line 131 of file pop.c.

References con_write_bl(), pop_invalid(), pop_user_parse(), and st_cleanup.

5.159.1.30 stringer_t* pop_user_parse (connection_t * con)

Parse a POP3 USER command.

Note:

The username can be at most 255 characters and will be returned in lowercase. This function will stop reading in username characters when an invalid character is encountered.

Parameters:

con the POP3 client connection that issued the USER command.

Returns:

a managed string containing the validated username, or NULL on failure.

Definition at line 257 of file parse.c.

References length, log_pedantic, lower_chr(), st_data_get(), st_import(), and st_length_get().

Referenced by pop_user().

5.160 src/network/read.c File Reference

```
#include "magma.h"
```

Functions

- `int64_t con_read_line (connection_t *con, bool_t block)`
Read a line of input from a network connection.
- `int64_t con_read (connection_t *con)`
Read data from a network connection, and store the data in the connection context buffer.
- `int64_t client_read_line (client_t *client)`
Read a line of input from a network client session.
- `int64_t client_read (client_t *client)`
Read data from a network connection, and store the data in the connection context buffer.

5.160.1 Function Documentation

5.160.1.1 `int64_t client_read (client_t * client)`

Read data from a network connection, and store the data in the connection context buffer. [read.c](#)

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 304 of file `read.c`.

References `bytes`, `client_status()`, `ip_presentation()`, `log_pedantic`, `MANAGEDBUF`, `MEMORYBUF`, `mm_move()`, `pl_length_get()`, `pl_null()`, `st_avail_get()`, `st_char_get()`, `st_data_get()`, `st_length_get()`, `st_length_int()`, `st_length_set()`, `status`, `tcp_status()`, `tls_cipher()`, `tls_error()`, and `tls_read()`.

5.160.1.2 `int64_t client_read_line (client_t * client)`

Read a line of input from a network client session.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 191 of file `read.c`.

References `bytes`, `ip_presentation()`, `line_pl_st()`, `log_pedantic`, `MANAGEDBUF`, `MEMORYBUF`, `mm_move()`, `pl_empty()`, `pl_length_get()`, `pl_null()`, `st_avail_get()`, `st_char_get()`, `st_data_get()`, `st_empty`, `st_length_get()`, `st_length_int()`, `st_length_set()`, `status`, `tcp_status()`, `tls_cipher()`, `tls_error()`, and `tls_read()`.

Referenced by `smtp_client_close()`, `smtp_client_connect()`, `smtp_client_send_data()`, `smtp_client_send_helo()`, `smtp_client_send_mailfrom()`, `smtp_client_send_nullfrom()`, and `smtp_client_send_rcptto()`.

5.160.1.3 int64_t con_read (connection_t * con)

Read data from a network connection, and store the data in the connection context buffer.

Note:

This function handles reading data from both regular and SSL connections. If the connection's network buffer hasn't been allocated, it will be initialized.

Parameters:

con a pointer to the connection object from which the data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 108 of file read.c.

References bytes, con_init_network_buffer(), con_status(), mm_move(), pl_length_get(), pl_null(), st_avail_get(), st_char_get(), st_data_get(), st_length_get(), st_length_set(), status, tcp_read(), and tls_read().

Referenced by http_body(), imap_parse_literal(), smtp_data_finish(), and smtp_data_read().

5.160.1.4 int64_t con_read_line (connection_t * con, bool_t block)

Read a line of input from a network connection.

Note:

This function handles reading data from both regular and ssl connections. This function continually attempts to read incoming data from the specified connection until a terminated line of input is received. If a new line is read, the length of that line is returned to the caller, including the trailing . If the read returns -1 and wasn't caused by a syscall interruption or blocking error, -1 is returned, and the connection status is set to -1. If the read returns 0 and wasn't caused by a syscall interruption or blocking error, -2 is returned, and the connection status is set to 2. Once a character is reached, the length of the current line of input is returned to the user, and the connection status is set to 1.

Parameters:

con the network connection across which the line of data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 21 of file read.c.

References bytes, con_init_network_buffer(), con_status(), line_pl_st(), mm_move(), pl_empty(), pl_length_get(), pl_null(), st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_set(), status, tcp_read(), and tls_read().

```
#include "magma.h"
```

Functions

- void [con_reverse_enqueue](#) ([connection_t](#) *con)
Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.
- void [con_reverse_domain](#) ([connection_t](#) *con, [stringer_t](#) *domain, [int_t](#) status)
Set the domain name and reverse lookup status of a connection.
- void [con_reverse_status](#) ([connection_t](#) *con, [int_t](#) status)
- [stringer_t](#) * [con_reverse_check](#) ([connection_t](#) *con, [uint32_t](#) timeout)
Poll a connection periodically to see if a reverse DNS lookup operation has completed.
- void [con_reverse_lookup](#) ([connection_t](#) *con)
Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

5.161.1 Function Documentation

5.161.1.1 [stringer_t](#)* [con_reverse_check](#) ([connection_t](#) * con, [uint32_t](#) timeout)

Poll a connection periodically to see if a reverse DNS lookup operation has completed. [reverse.c](#)

Note:

Polling will occur every 100ms, for as many seconds as specified by the user.

Parameters:

con the specified connection object to be polled that is the target of the DNS lookup.
timeout the number of seconds to wait for the lookup operation to complete.

Returns:

NULL on failure, or a pointer to a managed string containing the connection's peer hostname on success.

Definition at line 75 of file reverse.c.

References [mutex_lock\(\)](#), [mutex_unlock\(\)](#), [REVERSE_COMPLETE](#), [REVERSE_PENDING](#), and [status](#).

Referenced by [mail_add_inbound_headers\(\)](#), and [mail_add_outbound_headers\(\)](#).

5.161.1.2 void [con_reverse_domain](#) ([connection_t](#) * con, [stringer_t](#) * domain, [int_t](#) status)

Set the domain name and reverse lookup status of a connection.

Note:

Possible values for status include [REVERSE_ERROR](#), [REVERSE_EMPTY](#), [REVERSE_PENDING](#), and [REVERSE_COMPLETE](#).

Parameters:

domain the new value of the connection's hostname.

status the new value of the connection's reverse lookup status.

Returns:

This function returns no value.

Definition at line 42 of file reverse.c.

References mutex_lock(), and mutex_unlock().

Referenced by con_reverse_lookup().

5.161.1.3 void con_reverse_enqueue (connection_t * con)

Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.

Parameters:

con the connection object to be examined.

Returns:

This function returns no value.

Definition at line 15 of file reverse.c.

References con_reverse_lookup(), enqueue(), mutex_lock(), mutex_unlock(), REVERSE_EMPTY, and REVERSE_PENDING.

Referenced by dmtip_init(), http_init(), imap_init(), and smtp_init().

5.161.1.4 void con_reverse_lookup (connection_t * con)

Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

Parameters:

con the connection object to be queried.

Returns:

This function returns no value.

Definition at line 107 of file reverse.c.

References con_destroy(), con_reverse_domain(), con_reverse_status(), MEMORYBUF, ns_length_get(), REVERSE_COMPLETE, REVERSE_ERROR, and st_import().

Referenced by con_reverse_enqueue().

5.161.1.5 void con_reverse_status (connection_t * con, int_t status)

Definition at line 59 of file reverse.c.

References mutex_lock(), and mutex_unlock().

Referenced by con_reverse_lookup().

Functions

- `session_t * sess_create (connection_t *con, stringer_t *path, stringer_t *application)`
sessions.c
- `void sess_destroy (session_t *sess)`
Destroy a web session and its associated data.
- `int_t sess_get (connection_t *con, stringer_t *application, stringer_t *path, stringer_t *token)`
Try to retrieve the session associated with a client connection's supplied cookie.
- `uint64_t sess_key (void)`
Generate a random 12 digit 64-bit web session key.
- `uint64_t sess_number (void)`
Reserve a unique web session identifier.
- `void sess_ref_add (session_t *sess)`
Increment the web session's reference counter and update its timestamp.
- `void sess_ref_dec (session_t *sess)`
Decrement the web session's reference counter and update its timestamp.
- `time_t sess_ref_stamp (session_t *sess)`
Get the timestamp for a web session's reference counter.
- `uint64_t sess_ref_total (session_t *sess)`
Get the reference count of a web session.
- `bool_t sess_refresh_check (session_t *sess)`
Check to see if a web session is ready to be refreshed, and if so, disarm its trigger and update its refresh stamp.
- `void sess_refresh_flush (session_t *sess)`
Update a web session's refresh stamp and prevent redundant refreshing of a web session.
- `time_t sess_refresh_stamp (session_t *sess)`
Get the timestamp for the last time the session was refreshed.
- `void sess_release (session_t *sess)`
Release a web session.
- `void sess_serial_check (session_t *sess, uint64_t object)`
Queue a web session refresh if there is stale data.
- `stringer_t * sess_token (session_t *sess)`
Securely generate a unique zbase32-encoded token for a session.
- `void sess_trigger (session_t *sess)`
Set a web session's trigger so it will be refreshed as soon as possible.
- `void sess_update (session_t *sess)`

Update a session's underlying data and its refresh timestamp.

- void `sess_release_attachment` (`attachment_t` *attachment)

Free an attachment object.

- void `sess_release_composition` (`composition_t` *comp)

Free a composition object.

5.163.1 Function Documentation

5.163.1.1 `session_t`* `sess_create` (`connection_t` *con, `stringer_t` *path, `stringer_t` *application)

sessions.c sessions.c

Note:

The session stores the following data points: remote IP address, request path, application name, the specified http hostname, the remote client's user agent string, the server's host number, a unique session id, the server's current timestamp, a randomly- generated session key for authentication, and an encrypted token for the session returned to the user as a cookie.

Parameters:

con a pointer to the connection underlying the web session.

path a pointer to a managed string containing the pathname of the generating request (should be "/portal/camel").

application a pointer to a managed string containing the name of the parent application of the session (should be "portal").

Returns:

NULL on failure or a pointer to a newly allocated session object for the specified connection.

Definition at line 371 of file sessions.c.

References `con_addr()`, `con_secure()`, `CONTIGUOUS`, `HEAP`, `magma_t::host`, `inx_alloc()`, `inx_insert()`, `ip_copy()`, `log_pedantic`, `M_INX_LINKED`, `M_TYPE_UINT64`, `magma`, `MANAGED_T`, `MEMORYBUF`, `mm_alloc()`, `mm_free()`, `magma_t::number`, `objects`, `sess_destroy()`, `sess_key()`, `sess_number()`, `sess_ref_add()`, `sess_ref_dec()`, `sess_release_composition()`, `sess_token()`, `session_t`, `object_cache_t::sessions`, `st_dup_opts()`, `multi_t::u64`, and `multi_t::val`.

Referenced by `json_api_dispatch()`, and `portal_endpoint()`.

5.163.1.2 `void sess_destroy` (`session_t` *sess)

Destroy a web session and its associated data.

Parameters:

sess a pointer to the web session to be destroyed.

Returns:

This function returns no value.

Definition at line 59 of file sessions.c.

References `inx_cleanup()`, `meta_inx_remove()`, `META_PROTOCOL_WEB`, `mm_free()`, `mutex_destroy()`, and `st_cleanup`.

Referenced by `obj_cache_start()`, and `sess_create()`.

5.163.1.3 int_t sess_get (connection_t * con, stringer_t * application, stringer_t * path, stringer_t * token)

Try to retrieve the session associated with a client connection's supplied cookie.

Parameters:

- con* a pointer to the connection object sending the cookie.
- application* a managed string containing the application associated with the session.
- path* a managed string containing the path associated with the session.
- token* the encrypted user token retrieved from the supplied http cookie.

Returns:

1 if the cookie was found and valid, or one of the following values on failure: 0 = Session not found. -1 = Server error. -2 = Invalid token. -3 = Security violation / incorrect user-agent. -4 = Security violation / incorrect session key. -5 = Security violation / incorrect source address. -6 = Session terminated by logout. -7 = Session timed out.

Most session attributes need simple equality comparison, except for timeout checking. Make sure not to validate against a stale session that should have already timed out (which will have to be determined dynamically).

Definition at line 434 of file sessions.c.

References con_addr(), con_secure(), deprecated_scramble_decrypt(), deprecated_scramble_import(), magma_t::http, inx_delete(), inx_find(), inx_lock_read(), inx_unlock(), ip_addr_eq(), log_error, log_pedantic, M_TYPE_UINT64, magma, MEMORYBUF, number, objects, magma_t::secure, sess_ref_add(), sess_ref_dec(), sess_refresh_stamp(), sess_update(), object_cache_t::sessions, magma_t::sessions, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_data_get(), st_free(), st_length_int(), multi_t::u64, multi_t::val, and zbase32_decode().

Referenced by http_parse_context().

5.163.1.4 uint64_t sess_key (void)

Generate a random 12 digit 64-bit web session key.

Returns:

the randomly generated web session key as an unsigned 64 bit integer.

Definition at line 22 of file sessions.c.

References log_pedantic, rand_get_uint64(), and uint64_digits().

Referenced by sess_create().

5.163.1.5 uint64_t sess_number (void)

Reserve a unique web session identifier.

Returns:

a number containing a unique web session identifier.

Definition at line 43 of file sessions.c.

References mutex_lock(), mutex_unlock(), and sessions.

Referenced by sess_create().

5.163.1.6 void sess_ref_add (session_t * sess)

Increment the web session's reference counter and update its timestamp.

Parameters:

sess a pointer to the web session to be updated.

Returns:

This function returns no value.

Definition at line 87 of file sessions.c.

References mutex_lock(), and mutex_unlock().

Referenced by sess_create(), and sess_get().

5.163.1.7 void sess_ref_dec (session_t * sess)

Decrement the web session's reference counter and update its timestamp.

Parameters:

sess a pointer to the web session to be updated.

Returns:

This function returns no value.

Definition at line 112 of file sessions.c.

References mutex_lock(), and mutex_unlock().

Referenced by sess_create(), sess_get(), and sess_release().

5.163.1.8 time_t sess_ref_stamp (session_t * sess)

Get the timestamp for a web session's reference counter.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the last-modified UTC timestamp value of the specified web session.

Definition at line 162 of file sessions.c.

References mutex_lock(), and mutex_unlock().

Referenced by obj_cache_prune().

5.163.1.9 uint64_t sess_ref_total (session_t * sess)

Get the reference count of a web session.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the total number of references to the specified web session.

Definition at line 137 of file sessions.c.

References mutex_lock(), and mutex_unlock().

Referenced by obj_cache_prune().

5.163.1.10 bool_t sess_refresh_check (session_t * sess)

Check to see if a web session is ready to be refreshed, and if so, disarm its trigger and update its refresh stamp.

Note:
