

User Guide

Prime Fuelwood Stove

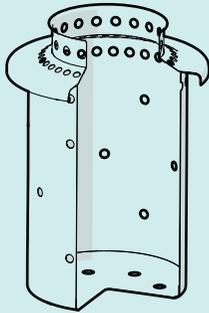

Fuelwood burning chamber

Preparation

Fuels that may be used with this burning chamber:

-  Fuelwood
-  Woodchips
-  Branches
-  Corncobs
-  Coconut husk

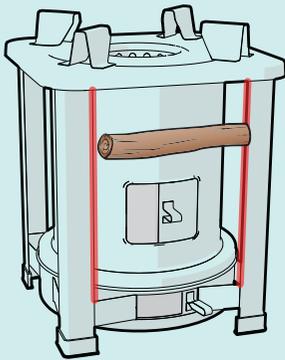

User guide using fuelwood as an example. Operating principles apply for all fuel types outlined above.

1

The fuelwood must be dry or your stove will be smoky!

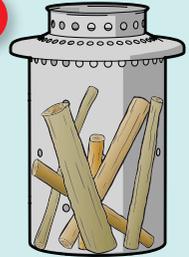

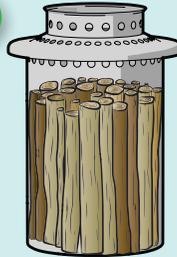

2

Max length of fuelwood

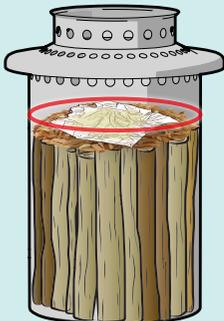

Prepare the fuelwood into appropriate length.

3

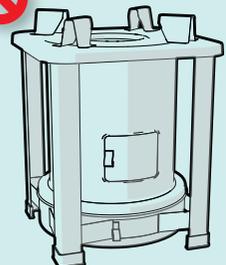

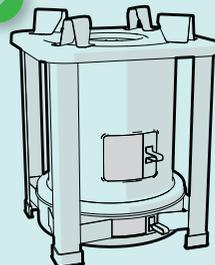

Fill the burning chamber with the fuelwood packed tightly.

4

Top the burning chamber with wood shavings, smaller twigs and paper.

5

The primary and secondary air regulators should be fully opened.

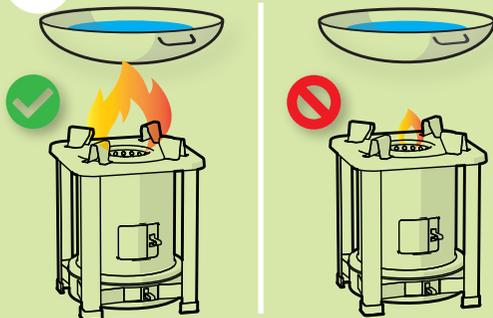

Cooking

1

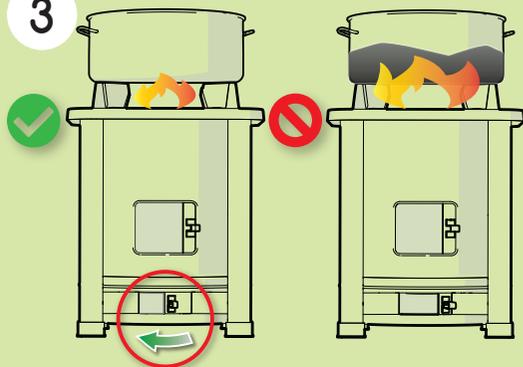

To ease ignition of your stove, use a bottle cap of kerosene or similar. Ignite with a match.

2

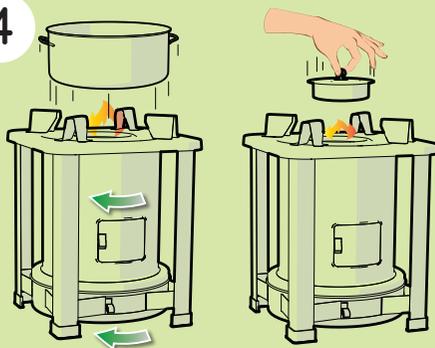

Wait until the flame is large before putting the pot on the stove.

3

Cook using a small flame to avoid your pot getting black. Do this by adjusting the primary air regulator.

4

When you have completed cooking, turn off your stove by closing all air regulators. Put the stove lid on to choke the fire.

5

When the flame has died out, empty the remains in a fireproof container or your garden.

6

Tip: If you have not used all the fuelwood inside the burning chamber, you can save this for the next cooking session by emptying the remaining fuelwood on the ground and covering it with sand or ash.

Maintenance

1

Do not leave your stove outside in the rain!

2

Do not pour water on the stove as it will make it rust!

3

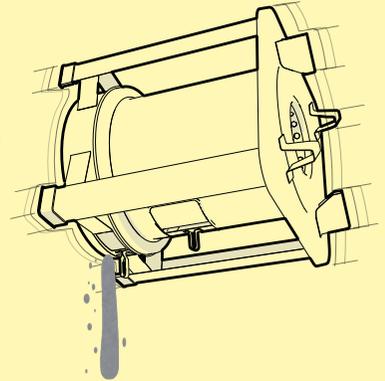

Do not touch your stove when hot!

4

Wipe your stove down with vegetable oil when it is not hot.

5

Empty the ash from the bottom of the stove using the primary air regulator.
